*Dedicated to Hélène Barcelo*

### Abstract

This paper is a supplement to [GR21], containing examples, remarks and additional material that could be useful to researchers working with Type  $GL_n$  Macdonald polynomials. In the course of our comparison of the alcove walk formula and the nonattacking fillings formulas for type  $GL_n$  Macdonald polynomials we did many examples and significant analysis of the literature. In the preparation of [GR21] it seemed sensible to produce a document with focus and this material was removed. This paper resurrects and organizes that material, in hopes that others may also find it useful.

**Key words**— Macdonald polynomials, affine Hecke algebras, tableaux

## 0 Introduction

This paper is a supplement to [GR21], containing examples, remarks and additional material that could be useful to researchers working with Type  $GL_n$  Macdonald polynomials. In the course of our comparison of the alcove walk formula and the nonattacking fillings formulas for type  $GL_n$  Macdonald polynomials we did many examples and significant analysis of the literature. In the preparation of [GR21] it seemed sensible to produce a document with focus and this material was removed. This is paper resurrects and organizes that material, in hopes that others may also find it useful.

1. The material in Section 1: Several colleagues have asked us questions about permuted basement Macdonald polynomials and KZ-families (the permuted basement Macdonald polynomials are called relative Macdonald polynomials in this paper). These questions are helpfully considered in the context of the results of the two paragraphs following equation (6.6) in Macdonald’s Séminaire Bourbaki article [Mac95] and Sections 5.4 and 5.5 of Macdonald’s followup book [Mac03] treating the fully general case. In hopes of making these results more accessible, in Section 1 we have recast these completely in the type  $GL_n$  and included their proofs (which are not difficult). These results are the  $H$ -decomposition in Section 1.1, symmetrization statement in Proposition 1.1, and the KZ-family characterization in Proposition 1.2. We hope that these type  $GL_n$  specific expositions of these results can be helpful to the community.
2. The material in Section 2: This section has a focus on counting the number of alcove walks and the number of nonattacking fillings, in order to compare the number of terms that appear in alcove walks formula and the nonattacking fillings formula for Macdonald polynomials. Some explicit formulas for these counts, which may not have been widely noticed before, are included.
3. The material in Section 3: This section explains how to recast the alcove walks and nonattacking fillings into path form and pipe dream form. Pictures are provided.
- 4,5,6. The material in Sections 4, 5 and 6: These sections provide explicit examples of the main results of [GR21]: the inversions and the box-greedy reduced word for  $u_\mu$  proved in [GR21, Proposition 2.2], the step-by-step and box-by-box recursions for computing Macdonald polynomials in [GR21, Proposition 4.1 and 4.3] and some specific examples to help support the exposition of the type  $GL_n$  double affine Hecke algebra (DAHA) given in [GR21, Section 5].
7. The material in Section 7: In this final section we provide additional explicit expansions of Macdonald polynomials for special cases:  $n = 2$ ,  $n = 3$ , a single column, partitions with 3 boxes, and explicit nonattacking fillings and their weights for  $E_\mu$  where  $\mu$  has less than 3 boxes.
8. Section 8 contains some brief remarks about the queue tableaux and multiline queues which appear in [CMW18, Section 1.2 and Definition A.2].

A small warning: Even though they all have a Type A root system, type  $SL_n$  Macdonald polynomials, type  $PGL_n$  Macdonald polynomials and type  $GL_n$  Macdonald polynomials are all *different*

(though the relationship is well known and not difficult). We should stress that this paper is specific to the  $GL_n$ -case and some results of this paper do not hold for Type  $SL_n$  or type  $PGL_n$  unless properly modified.

We thank L. Williams and M. Wheeler for bringing our attention to [CMW18] and [BW19], both of which were important stimuli during our work. We are also very grateful for the encouragement, questions, and discussions from A. Hicks, S. Mason, O. Mandelshtam, Z. Daugherty, Y. Naqvi, S. Assaf, and especially A. Garsia and S. Corteel, which helped so much in getting going and keeping up the energy. We thank S. Billey, Z. Daugherty, C. Lenart and J. Saied for very useful specific comments for improving the exposition. A. Ram extends a very special and heartfelt thank you to P. Diaconis who has provided unfailing support and advice and honesty and encouragement.

## 1 Symmetrization, $H$ decomposition of $\mathbb{C}[X]$ and KZ-families

Let  $q, t^{\frac{1}{2}} \in \mathbb{C}^\times$ . Following the notation of [Mac, Ch. VI (3.1)], let  $T_{q^{-1},x_1}$  be the operator on  $\mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}]$  given by

$$T_{q^{-1},x_n} h(x_1, \dots, x_n) = h(x_1, \dots, x_{n-1}, q^{-1}x_n).$$

The symmetric group  $S_n$  acts on  $\mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}]$  by permuting the variables  $x_1, \dots, x_n$ . Define operators  $T_1, \dots, T_{n-1}$ ,  $g$  and  $g^\vee$  on  $\mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}]$  by

$$T_i = t^{-\frac{1}{2}} \left( t - \frac{tx_i - x_{i+1}}{x_i - x_{i+1}} (1 - s_i) \right), \quad g = s_1 s_2 \cdots s_{n-1} T_{q^{-1},x_n}, \quad g^\vee = x_1 T_1 \cdots T_{n-1}, \quad (1.1)$$

where  $s_1, \dots, s_{n-1}$  are the simple transpositions in  $S_n$ . The *Cherednik-Dunkl operators* are

$$Y_1 = g T_{n-1} \cdots T_1, \quad Y_2 = T_1^{-1} Y_1 T_1^{-1}, \quad Y_3 = T_2^{-1} Y_2 T_2^{-1}, \quad \dots, \quad Y_n = T_{n-1}^{-1} Y_{n-1} T_n^{-1}. \quad (1.2)$$

For  $\mu \in \mathbb{Z}^n$  the *nonsymmetric Macdonald polynomial*  $E_\mu$  is the (unique) element  $E_\mu \in \mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}]$  such that

$$Y_i E_\mu = q^{-\mu_i} t^{-(v_\mu(i)-1)+\frac{1}{2}(n-1)} E_\mu, \quad \text{and the coefficient of } x_1^{\mu_1} \cdots x_n^{\mu_n} \text{ in } E_\mu \text{ is 1,} \quad (1.3)$$

where  $v_\mu \in S_n$  is the minimal length permutation such that  $v_\mu \mu$  is weakly increasing.

Let  $\mu = (\mu_1, \dots, \mu_n)$  and let  $z \in S_n$ .

$$\text{The relative Macdonald polynomial } E_\mu^z \text{ is} \quad E_\mu^z = t^{-\frac{1}{2}(\ell(zv_\mu^{-1}) - \ell(v_\mu^{-1}))} T_z E_\mu. \quad (1.4)$$

Let  $\lambda = (\lambda_1 \geq \cdots \geq \lambda_n) \in \mathbb{Z}^n$ .

$$\text{The symmetric Macdonald polynomial } P_\lambda \text{ is} \quad P_\lambda = \sum_{\nu \in S_n \lambda} t^{\frac{1}{2}\ell(z_\nu)} T_{z_\nu} E_\lambda, \quad (1.5)$$

where the sum is over rearrangements  $\nu$  of  $\lambda$  and  $z_\nu \in S_n$  is minimal length such that  $\nu = z_\nu \lambda$ .

### 1.1 The $H$ -modules $\mathbb{C}[X]^\lambda$

Let  $H$  be the algebra generated by the operators  $T_1, \dots, T_{n-1}$  and  $Y_1, \dots, Y_n$  (so that  $H$  is an affine Hecke algebra) and let

$$\tau_i^\vee = T_i + \frac{t^{-\frac{1}{2}}(1-t)}{1 - Y_i^{-1} Y_{i+1}} \quad \text{for } i \in \{1, \dots, n-1\}.$$

As  $H$ -modules

$$\mathbb{C}[x_1^{\pm 1}, \dots, x_n^{\pm 1}] = \bigoplus_{\lambda} \mathbb{C}[X]^{\lambda} \quad \text{where} \quad \mathbb{C}[X]^{\lambda} = \text{span}\{E_{\mu} \mid \mu \in S_n \lambda\},$$

and the direct sum is over decreasing  $\lambda = (\lambda_1 \geq \dots \geq \lambda_n) \in \mathbb{Z}^n$ . A description of the action of  $H$  on  $\mathbb{C}[X]^{\lambda}$  is given by the following. Let  $\mu \in \mathbb{Z}^n$  and, with notations as in (1.3), let

$$\begin{aligned} a_{\mu} &= q^{\mu_i - \mu_{i+1}} t^{v_{\mu}(i) - v_{\mu}(i+1)}, \\ a_{s_i \mu} &= q^{\mu_{i+1} - \mu_i} t^{v_{\mu}(i+1) - v_{\mu}(i)}, \end{aligned} \quad \text{and} \quad D_{\mu} = \frac{(1 - ta_{\mu})(1 - ta_{s_i \mu})}{(1 - a_{\mu})(1 - a_{s_i \mu})}.$$

Assume that  $\mu_i > \mu_{i+1}$ . By using the identity  $E_{s_i \nu} = t^{\frac{1}{2}} \tau_i^{\vee} E_{\nu}$  if  $\nu_{i+1} > \nu_i$  from [GR21, (3.5)], the eigenvalue from (1.3) and [GR21, Proposition 5.5 (5.23)], it is straightforward to compute that

$$\begin{aligned} Y_i^{-1} Y_{i+1} E_{\mu} &= a_{\mu} E_{\mu}, & t^{\frac{1}{2}} \tau_i^{\vee} E_{\mu} &= E_{s_i \mu}, & t^{\frac{1}{2}} T_i E_{\mu} &= -\frac{1-t}{1-a_{\mu}} E_{\mu} + E_{s_i \mu}, \\ Y_i^{-1} Y_{i+1} E_{s_i \mu} &= a_{s_i \mu} E_{s_i \mu}, & t^{\frac{1}{2}} \tau_i^{\vee} E_{s_i \mu} &= D_{\mu} E_{\mu}, & t^{\frac{1}{2}} T_i E_{s_i \mu} &= D_{\mu} E_{\mu} + \frac{1-t}{1-a_{s_i \mu}} E_{s_i \mu}. \end{aligned} \quad (1.6)$$

Now assume that  $\mu_i = \mu_{i+1}$ . Then  $v_{\mu}(i+1) = v_{\mu}(i) + 1$  and  $a_{\mu} = t^{-1}$  so that

$$Y_i^{-1} Y_{i+1} E_{\mu} = t^{-1} E_{\mu}, \quad (t^{\frac{1}{2}} \tau_i^{\vee}) E_{\mu} = 0, \quad \text{and} \quad (t^{\frac{1}{2}} T_i) E_{\mu} = t E_{\mu}. \quad (1.7)$$

These formulas make explicit the action of  $H$  on  $\mathbb{C}[X]^{\lambda}$  in the basis  $\{E_{\mu} \mid \mu \in S_n \lambda\}$ . The formulas in (1.6) are the type  $GL_n$  special cases of [Mac03, (5.4.3),(5.6.6)].

## 1.2 Symmetrization of $E_{\mu}$ for $\mu \in \mathbb{Z}^n$

If  $z \in S_n$  and

$$z = s_{i_1} \cdots s_{i_{\ell}} \text{ is a reduced word,} \quad \text{let} \quad T_z = T_{i_1} \cdots T_{i_{\ell}}.$$

Let  $w_0$  be the longest element of  $S_n$  so that

$$w_0(i) = n - i + 1, \text{ for } i \in \{1, \dots, n\}, \quad \text{and} \quad \ell(w_0) = \frac{n(n-1)}{2} = \binom{n}{2}.$$

Following [Mac03, (5.5.7), (5.5.16), (5.5.17)], let

$$\mathbf{1}_0 = t^{-\frac{1}{2} \ell(w_0)} \sum_{z \in S_n} t^{\frac{1}{2} \ell(z)} T_z, \quad \text{so that} \quad T_i \mathbf{1}_0 = \mathbf{1}_0 T_i = t^{\frac{1}{2}} \mathbf{1}_0 \quad \text{for } i \in \{1, \dots, n-1\}, \quad (1.8)$$

and

$$\mathbf{1}_0^2 = W_0(t) \mathbf{1}_0, \quad \text{where} \quad W_0(t) = \sum_{z \in S_n} t^{\ell(z)} \quad (1.9)$$

is the *Poincaré polynomial* for  $S_n$ .

For  $\mu \in \mathbb{Z}^n$ , the *symmetrization* of  $E_{\mu}$  is (see [Mac03, (5.7.1)] and [Mac95, Remarks after (6.8)])

$$F_{\mu} = \mathbf{1}_0 E_{\mu} = t^{-\frac{1}{2} \ell(w_0)} \sum_{z \in S_n} t^{\frac{1}{2}(\ell(z) - \ell(zv_{\mu}^{-1}) + \ell(v_{\mu}^{-1}))} E_{\mu}^z, \quad (1.10)$$

so that  $F_{\mu}$  is a (weighted) sum of the relative Macdonald polynomials  $E_{\mu}^z$  defined in (1.4)). The following Proposition shows that  $F_{\mu}$  is always, up to an explicit constant factor, equal to the symmetric Macdonald polynomial  $P_{\lambda}$  (defined in (1.5)). Proposition 1.1 is the specialization of [Mac95, remarks after (6.8)] and [Mac03, (5.7.2)] to our setting.

**Proposition 1.1.** Let  $\mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}^n$ . Let  $\lambda = (\lambda_1, \dots, \lambda_n)$  be the weakly decreasing rearrangement of  $\mu$  and let  $z_\mu \in S_n$  be minimal length such that  $\mu = z_\mu \lambda$ . Let

$$S_\lambda = \{y \in S_n \mid y\lambda = \lambda\} \quad \text{and} \quad W_\lambda(t) = \sum_{y \in S_\lambda} t^{\ell(y)}.$$

Then

$$P_\lambda = \frac{t^{\frac{1}{2}\ell(w_0)}}{W_\lambda(t)} \left( \prod_{(i,j) \in \text{Inv}(z_\mu)} \frac{1 - q^{\lambda_i - \lambda_j} t^{j-i}}{1 - q^{\lambda_i - \lambda_j} t^{j-i+1}} \right) F_\mu.$$

*Proof.* The proof is by induction on  $\ell(z_\mu)$ . The base case  $z_\mu = 1$  has  $\mu = \lambda$  and  $v_\lambda = w_0 z_\lambda$  so that

$$\begin{aligned} F_\lambda &= \mathbf{1}_0 E_\lambda = t^{-\frac{1}{2}\ell(w_0)} \left( \sum_{u \in S_n / S_\lambda} \sum_{v \in S_\lambda} t^{\frac{1}{2}\ell(x) + \ell(y)} T_x T_y \right) E_\lambda \\ &= t^{-\frac{1}{2}\ell(w_0)} \left( \sum_{u \in S_n / S_\lambda} t^{\frac{1}{2}\ell(x)} T_x \right) W_\lambda(t) E_\lambda = t^{-\frac{1}{2}\ell(w_0)} W_\lambda(t) P_\lambda, \end{aligned}$$

where  $T_y E_\lambda = t^{\frac{1}{2}\ell(y)} E_y$  is a consequence of (1.7) and the last equality is (1.5). For the induction step, assume that  $\mu$  is not weakly decreasing and let  $i \in \{1, \dots, n-1\}$  be such that  $\mu_i < \mu_{i+1}$ . Then  $z_{s_i \mu} = s_i z_\mu$  and  $\ell(z_{s_i \mu}) = \ell(z_\mu) - 1$ . Using  $E_\mu = t^{\frac{1}{2}} \tau_i^\vee E_{s_i \mu}$  and  $\mathbf{1}_0 T_i = \mathbf{1}_0 t^{\frac{1}{2}}$  from (1.6) and (1.7) gives

$$\begin{aligned} F_\mu &= \mathbf{1}_0 E_\mu = \mathbf{1}_0 t^{\frac{1}{2}} \tau_i E_{s_i \mu} = \mathbf{1}_0 \left( t^{\frac{1}{2}} T_i + \frac{1-t}{1-Y_i^{-1} Y_{i+1}} \right) E_{s_i \mu} = \mathbf{1}_0 \left( t + \frac{1-t}{1-Y_i^{-1} Y_{i+1}} \right) E_{s_i \mu} \\ &= \mathbf{1}_0 \frac{1-t Y_i^{-1} Y_{i+1}}{1-Y_i^{-1} Y_{i+1}} E_{s_i \mu} = \mathbf{1}_0 \frac{1-t q^{\mu_{i+1}-\mu_i} t^{v_\mu(i+1)-v_\mu(i)}}{1-q^{\mu_{i+1}-\mu_i} t^{v_\mu(i+1)-v_\mu(i)}} E_{s_i \mu} = \frac{1-q^{\mu_{i+1}-\mu_i} t^{v_\mu(i+1)-v_\mu(i)+1}}{1-q^{\mu_{i+1}-\mu_i} t^{v_\mu(i+1)-v_\mu(i)}} F_{s_i \mu} \end{aligned}$$

and the result follows by induction (see Section 1.3.3 for an example).  $\square$

### 1.3 The KZ-family basis of $\mathbb{C}[X]^\lambda$

For  $\mu \in \mathbb{Z}^n$ , let  $\lambda = (\lambda_1 \geq \dots \geq \lambda_n)$  be the decreasing rearrangement of  $\mu$  and let  $z_\mu \in S_n$  be minimal length such that  $\mu = z_\mu \lambda$ . Define

$$f_\mu = E_\lambda^{z_\mu} = t^{\frac{1}{2}\ell(z_\mu)} T_{z_\mu} E_\lambda. \quad (1.11)$$

It follows from the identities in the last column of (1.6) that

$$\{f_\mu \mid \mu \in S_n \lambda\} \quad \text{is another basis of } \mathbb{C}[X]^\lambda.$$

The following Proposition says that the  $\{f_\mu \mid \mu \in \mathbb{Z}^n\}$  form a KZ-family, in the terminology of [KT06, Def. 3.3] (see also [CMW18, Def. 1.13], [CdGW15, (17), (18), (19)], [CdGW16, Def. 2]).

**Proposition 1.2.** Let  $\mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}_{\geq 0}^n$ . Let  $i \in \{1, \dots, n-1\}$  and let  $T_i$  and  $g$  be as defined in (1.1). Then

$$t^{\frac{1}{2}} T_i f_\mu = \begin{cases} f_{s_i \mu}, & \text{if } \mu_i > \mu_{i+1}, \\ t f_\mu, & \text{if } \mu_i = \mu_{i+1}, \end{cases} \quad \text{and} \quad g f_\mu = q^{-\mu_n} f_{(\mu_n, \mu_1, \dots, \mu_{n-1})}.$$

*Proof.* Assume  $\mu_i > \mu_{i+1}$ . Then  $z_{s_i \mu} = s_i z_\mu$  and  $\ell(z_{s_i \mu}) = \ell(z_\mu) + 1$  so that

$$t^{\frac{1}{2}} T_i f_\mu = t^{\frac{1}{2}} T_i t^{\frac{1}{2}\ell(z_\mu)} T_{z_\mu} E_\lambda = t^{\frac{1}{2}\ell(z_{s_i \mu})} T_{z_{s_i \mu}} E_\lambda = f_{s_i \mu}.$$

Assume  $\mu_i = \mu_{i+1}$ . Then there exists  $j \in \{1, \dots, n-1\}$  such that  $s_j \lambda = \lambda$  and  $s_i z_\mu = z_\mu s_j$  (so that  $s_i \mu = s_i z_\mu \lambda = z_\mu s_j \lambda$ ). Then

$$t^{\frac{1}{2}} T_i f_\mu = t^{\frac{1}{2}} T_i t^{\frac{1}{2}\ell(z_\mu)} T_{z_\mu} E_\lambda = t^{\frac{1}{2}\ell(z_\mu)} T_{z_\mu} t^{\frac{1}{2}} T_j E_\lambda = t^{\frac{1}{2}\ell(z_\mu)} T_{z_\mu} t E_\lambda = t f_\mu.$$

(c) Let  $\mu = (\mu_1, \dots, \mu_n)$  and let  $i$  and  $j$  be such that  $\lambda_i$  is the first part of  $\lambda$  equal to  $\mu_n$  and  $\lambda_j$  is the last part of  $\lambda$  equal to  $\mu_n$ . Thus  $\mu_n = \lambda_i = \lambda_{i+1} = \dots = \lambda_j$ . Write  $z_\mu = z s_{n-1} \cdots s_j$  with  $z \in S_{n-1}$  and let  $c_n = s_1 \cdots s_{n-1}$ . Then, using  $v_\lambda(j) = 1 + (j - i) + n - j = n - i + 1$  from [GR21, Proposition 2.1(a)],

$$\begin{aligned} g f_\mu &= g t^{\frac{1}{2}\ell(z_\mu)} T_{z_\mu} E_\lambda = g t^{\frac{1}{2}\ell(z)} T_z t^{\frac{1}{2}(n-j)} T_{n-1} \cdots T_j E_\lambda = t^{\frac{1}{2}(n-j)} g t^{\frac{1}{2}\ell(z)} T_z g^{-1} g T_{n-1} \cdots T_j E_\lambda \\ &= t^{\frac{1}{2}(n-j)} (g t^{\frac{1}{2}\ell(z)} T_z g^{-1}) T_1 \cdots T_{j-1} (T_{j-1}^{-1} \cdots T_1^{-1} g T_{n-1} \cdots T_j) E_\lambda \\ &= t^{\frac{1}{2}(n-j)} (t^{\frac{1}{2}\ell(z)} T_{c_n z c_n^{-1}}) T_1 \cdots T_{j-1} Y_j E_\lambda \\ &= t^{\frac{1}{2}(n-j)} (t^{\frac{1}{2}\ell(z)} T_{c_n z c_n^{-1}}) T_1 \cdots T_{j-1} q^{-\lambda_j} t^{-(v_\lambda(j)-1)+\frac{1}{2}(n-1)} E_\lambda \\ &= q^{-\lambda_j} t^{\frac{1}{2}(n-j)-(n-i+1-1)+\frac{1}{2}(n-1)} (t^{\frac{1}{2}\ell(z)} T_{c_n z c_n^{-1}}) T_1 \cdots T_{i-1} T_i \cdots T_{j-1} E_\lambda \\ &= q^{-\mu_n} t^{-\frac{1}{2}j+i-\frac{1}{2}} (t^{\frac{1}{2}\ell(z)} T_{c_n z c_n^{-1}}) T_1 \cdots T_{i-1} t^{\frac{1}{2}(j-i)} E_\lambda \\ &= q^{-\mu_n} (t^{\frac{1}{2}\ell(z)} T_{c_n z c_n^{-1}}) t^{\frac{1}{2}(i-1)} T_1 \cdots T_{i-1} E_\lambda = q^{-\mu_n} f_{(\lambda_i, \mu_1, \dots, \mu_{n-1})} = q^{-\mu_n} f_{(\mu_n, \mu_1, \dots, \mu_{n-1})}, \end{aligned}$$

where the next to last equality follows from  $s_1 \cdots s_{i-1}(\lambda_1, \dots, \lambda_n) = (\lambda_i, \lambda_1, \dots, \lambda_{i-1}, \lambda_{i+1}, \dots, \lambda_n)$  and  $c_n z c_n^{-1}(\lambda_i, \lambda_1, \dots, \lambda_{i-1}, \lambda_{i+1}, \dots, \lambda_n) = (\lambda_i, \mu_1, \dots, \mu_{n-1})$ .  $\square$

### 1.3.1 Examples of the elements $E_\mu$ and $f_\mu$ in $\mathbb{C}[X]^{(2,1,0)}$ .

$$\begin{aligned}
 E_{(2,1,0)} &= x_1^2 x_2 + \left( \frac{1-t}{1-qt^2} \right) q x_1 x_2 x_3, \\
 E_{(2,0,1)} &= x_1^2 x_3 + \left( \frac{1-t}{1-qt} \right) x_1^2 x_2 + \left( \frac{1-t}{1-qt} \right) q x_1 x_2 x_3, \\
 E_{(1,2,0)} &= x_1 x_2^2 + \left( \frac{1-t}{1-qt} \right) x_1^2 x_2 + \left( \frac{1-t}{1-qt} \right) q x_1 x_2 x_3, \\
 E_{(0,2,1)} &= x_2^2 x_3 + \left( \frac{1-t}{1-qt} \right) x_1 x_2^2 + \left( \frac{1-t}{1-q^2 t^2} \right) x_1^2 x_3 + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) x_1^2 x_2 \\
 &\quad + \left( \left( \frac{1-t}{1-qt} \right) + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) q \right) x_1 x_2 x_3, \\
 E_{(1,0,2)} &= x_1 x_3^2 + \left( \frac{1-t}{1-qt} \right) x_1^2 x_3 + \left( \frac{1-t}{1-q^2 t^2} \right) x_1 x_2^2 + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) x_1^2 x_2 \\
 &\quad + \left( \left( \frac{1-t}{1-qt} \right) + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) q \right) x_1 x_2 x_3, \\
 E_{(0,1,2)} &= x_2 x_3^2 + \left( \frac{1-t}{1-qt} \right) x_2^2 x_3 + \left( \frac{1-t}{1-qt} \right) x_1 x_3^2 + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) x_1^2 x_3 \\
 &\quad + \left( \frac{1-t}{1-q^2 t^2} \right) t x_1^2 x_2 + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right)^2 x_1^2 x_2 \\
 &\quad + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) q t x_1 x_2^2 + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) x_1 x_2^2 \\
 &\quad + \left( \frac{1-t}{1-qt} \right)^2 x_1 x_2 x_3 + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right) q t x_1 x_2 x_3 \\
 &\quad + \left( \frac{1-t}{1-q^2 t^2} \right) \left( \frac{1-t}{1-qt} \right)^2 q x_1 x_2 x_3 + \left( \frac{1-t}{1-qt} \right) x_1 x_2 x_3, \\
 f_{(2,1,0)} &= E_{(2,1,0)} = x_1^2 x_2 + q \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3, \\
 f_{(1,2,0)} &= t^{\frac{1}{2}} T_{s_1} E_{(2,1,0)} = x_1 x_2^2 + t^{-1} \frac{(1-t)qt^2}{(1-qt^2)} x_1 x_2 x_3, \\
 f_{(2,0,1)} &= t^{\frac{1}{2}} T_{s_2} E_{(2,1,0)} = x_1^2 x_3 + t^{-1} \frac{(1-t)qt^2}{(1-qt^2)} x_1 x_2 x_3, \\
 f_{(1,0,2)} &= t^{\frac{2}{2}} T_{s_2} T_{s_1} E_{(2,1,0)} = x_1 x_3^2 + \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3, \\
 f_{(0,2,1)} &= t^{\frac{2}{2}} T_{s_1} T_{s_2} E_{(2,1,0)} = x_2^2 x_3 + \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3, \\
 f_{(0,1,2)} &= t^{\frac{3}{2}} T_{s_1} T_{s_2} T_{s_1} E_{(2,1,0)} = x_2 x_3^2 + t \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3,
 \end{aligned}$$

### 1.3.2 $P_{(2,1,0)}$ as a symmetrization of $E_{(2,1,0)}$

When  $n = 3$  then

$$\begin{aligned}
 W_0(t) &= \sum_{w \in S_3} t^{\ell(w)} = 1 + t + t + t^2 + t^2 + t^3 = (1+t)(1+t+t^2) = \frac{(1-t^2)(1-t^3)}{(1-t)(1-t)}, \quad \text{and} \\
 \mathbf{1}_0 &= t^{-\frac{3}{2}} + t^{-\frac{2}{2}} T_1 + t^{-\frac{2}{2}} T_2 + t^{-\frac{1}{2}} T_1 T_2 + t^{-\frac{1}{2}} T_2 T_1 + T_1 T_2 T_1.
 \end{aligned}$$

Since  $W_{(2,1,0)} = \{1\}$  then  $W_{(2,1,0)}(t) = 1$  and

$$P_{(2,1,0)} = \frac{t^{\frac{3}{2}}}{W_{(2,1,0)}(t)} \mathbf{1}_0 E_{(2,1,0)} = t^{\frac{3}{2}} \mathbf{1}_0 t^{-\frac{3}{2}} \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee \mathbf{1},$$

and, with  $f_{(2,1,0)}, f_{(1,2,0)}, \dots, f_{(0,1,2)}$  as in Section 1.3.1,

$$\begin{aligned} P_{(2,1,0)} &= (1 + t^{\frac{1}{2}} T_1 + t^{\frac{1}{2}} T_2 + t^{\frac{2}{2}} T_1 T_2 + t^{\frac{2}{2}} T_2 T_1 + t^{\frac{3}{2}} T_1 T_2 T_1) E_{(2,1,0)} \\ &= f_{(2,1,0)} + f_{(1,2,0)} + f_{(2,0,1)} + f_{(1,0,2)} + f_{(0,2,1)} + f_{(0,1,2)} \\ &= (x_1^2 x_2 + q \frac{(1-t)}{1-qt^2} x_1 x_2 x_3) + (x_1 x_2^2 + qt \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3) + (x_1^2 x_3 + qt \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3) \\ &\quad + (x_1 x_3^2 + \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3) + (x_2^2 x_3 + \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3) + (x_2 x_3^2 + t \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3) \\ &= x_1^2 x_2 + x_1 x_2^2 + x_1^2 x_3 + x_1 x_3^2 + x_2^2 x_3 + x_2 x_3^2 + \left( \frac{(1-t^2)}{(1-qt)} \frac{(1-q^2 t)}{(1-qt^2)} + \frac{(1-t)}{(1-q)} \frac{(1-q^2)}{(1-qt)} \right) x_1 x_2 x_3. \end{aligned}$$

### 1.3.3 Symmetrizations for $\mu$ with distinct parts when $n = 3$ .

For example, if  $n = 3$  and  $\lambda_1 > \lambda_2 > \lambda_3$  then  $W_\lambda = \{1\}$  and  $W_\lambda(t) = 1$  and  $w_0 = s_1 s_2 s_1$  and  $\ell(w_0) = 3$ . So

$$\begin{aligned} F_{(\lambda_1, \lambda_2, \lambda_3)} &= t^{\frac{3}{2}} \mathbf{1}_0 E_{(\lambda_1, \lambda_2, \lambda_3)} = P_{(\lambda_1, \lambda_2, \lambda_3)}, \\ F_{(\lambda_2, \lambda_1, \lambda_3)} &= t^{\frac{3}{2}} \left( \frac{1 - tq^{\lambda_1 - \lambda_2} t^{2-1}}{1 - q^{\lambda_1 - \lambda_2} t^{2-1}} \right) P_{(\lambda_1, \lambda_2, \lambda_3)} \\ F_{(\lambda_1, \lambda_3, \lambda_2)} &= t^{\frac{3}{2}} \left( \frac{1 - tq^{\lambda_2 - \lambda_3} t^{3-2}}{1 - q^{\lambda_2 - \lambda_3} t^{3-2}} \right) P_{(\lambda_1, \lambda_2, \lambda_3)} \\ F_{(\lambda_2, \lambda_3, \lambda_1)} &= t^{\frac{3}{2}} \left( \frac{1 - tq^{\lambda_1 - \lambda_3} t^{3-1}}{1 - q^{\lambda_1 - \lambda_3} t^{3-1}} \right) \left( \frac{1 - tq^{\lambda_1 - \lambda_2} t^{2-1}}{1 - q^{\lambda_1 - \lambda_2} t^{2-1}} \right) P_{(\lambda_1, \lambda_2, \lambda_3)} \\ F_{(\lambda_3, \lambda_1, \lambda_2)} &= t^{\frac{3}{2}} \left( \frac{1 - tq^{\lambda_1 - \lambda_3} t^{3-1}}{1 - q^{\lambda_1 - \lambda_3} t^{3-1}} \right) \left( \frac{1 - tq^{\lambda_2 - \lambda_3} t^{3-2}}{1 - q^{\lambda_2 - \lambda_3} t^{3-2}} \right) P_{(\lambda_1, \lambda_2, \lambda_3)} \\ F_{(\lambda_3, \lambda_2, \lambda_1)} &= t^{\frac{3}{2}} \left( \frac{1 - tq^{\lambda_1 - \lambda_2} t^{2-1}}{1 - q^{\lambda_1 - \lambda_2} t^{2-1}} \right) \left( \frac{1 - tq^{\lambda_1 - \lambda_3} t^{3-1}}{1 - q^{\lambda_1 - \lambda_3} t^{3-1}} \right) \left( \frac{1 - tq^{\lambda_2 - \lambda_3} t^{3-2}}{1 - q^{\lambda_2 - \lambda_3} t^{3-2}} \right) P_{(\lambda_1, \lambda_2, \lambda_3)} \end{aligned}$$

since, for example, using

$$v_\lambda(1) = 3, \quad v_\lambda(2) = 2, \quad v_\lambda(3) = 1, \quad \text{and} \quad Y_i^{-1} Y_j E_{(\lambda_1, \lambda_2, \lambda_3)} = q^{\lambda_i - \lambda_j} t^{v_\lambda(i) - v_\lambda(j)} E_{(\lambda_1, \lambda_2, \lambda_3)}$$

and  $v_\lambda(i) - v_\lambda(j) = (n - i + 1) - (n - j + 1) = i - j$ ,

$$\begin{aligned}
 F_{(\lambda_2, \lambda_1, \lambda_3)} &= \mathbf{1}_0 t^{\frac{1}{2}} \tau_1^\vee E_{(\lambda_1, \lambda_2, \lambda_3)} = \mathbf{1}_0 \left( t^{\frac{1}{2}} T_1 + \frac{(1-t)}{1-Y_1^{-1}Y_2} \right) E_{(\lambda_1, \lambda_2, \lambda_3)} \\
 &= \mathbf{1}_0 \left( t + \frac{(1-t)}{1-Y_1^{-1}Y_2} \right) E_{(\lambda_1, \lambda_2, \lambda_3)} = \mathbf{1}_0 \left( \frac{1-tY_1^{-1}Y_2}{1-Y_1^{-1}Y_2} \right) E_{(\lambda_1, \lambda_2, \lambda_3)} \\
 &= \mathbf{1}_0 \left( \frac{1-tq^{\lambda_1-\lambda_2}t^{2-1}}{1-q^{\lambda_1-\lambda_2}t^{2-1}} \right) E_{(\lambda_1, \lambda_2, \lambda_3)} = \left( \frac{1-tq^{\lambda_1-\lambda_2}t^{2-1}}{1-q^{\lambda_1-\lambda_2}t^{2-1}} \right) P_{(\lambda_1, \lambda_2, \lambda_3)} \\
 F_{(\lambda_2, \lambda_3, \lambda_1)} &= \mathbf{1}_0 t^{\frac{1}{2}} \tau_2^\vee t^{\frac{1}{2}} \tau_1^\vee E_{(\lambda_1, \lambda_2, \lambda_3)} = \mathbf{1}_0 \left( \frac{1-tY_2^{-1}Y_3}{1-Y_2^{-1}Y_3} \right) t^{\frac{1}{2}} \tau_1^\vee E_{(\lambda_1, \lambda_2, \lambda_3)} \\
 &= \mathbf{1}_0 t^{\frac{1}{2}} \tau_1^\vee \left( \frac{1-tY_1^{-1}Y_3}{1-Y_1^{-1}Y_3} \right) E_{(\lambda_1, \lambda_2, \lambda_3)} = \mathbf{1}_0 t^{\frac{1}{2}} \tau_1^\vee \left( \frac{1-tq^{\lambda_1-\lambda_3}t^{3-1}}{1-q^{\lambda_1-\lambda_3}t^{3-1}} \right) E_{(\lambda_1, \lambda_2, \lambda_3)} \\
 &= \left( \frac{1-tq^{\lambda_1-\lambda_3}t^{3-1}}{1-q^{\lambda_1-\lambda_3}t^{3-1}} \right) \left( \frac{1-tq^{\lambda_1-\lambda_2}t^{2-1}}{1-q^{\lambda_1-\lambda_2}t^{2-1}} \right) P_{(\lambda_1, \lambda_2, \lambda_3)}
 \end{aligned}$$

### 1.3.4 Examples of the $gf_\mu$ condition for a KZ-family.

Let  $n = 3$  and  $\lambda = (2, 1, 0)$ . Then  $v_\lambda(1) = 3$ ,  $v_\lambda(2) = 2$  and  $v_\lambda(3) = 1$  and

$$Y_i E_{(2,1,0)} = q^{-\lambda_i} t^{-(v_\lambda(i)-1)+\frac{1}{2}(n-1)} E_{(2,1,0)}.$$

Then

$$Y_1 = gT_2T_1, \quad Y_2 = T_1^{-1}gT_2, \quad Y_3 = T_2^{-1}T_1^{-2}g,$$

Since

$$\begin{aligned}
 f_{(2,1,0)} &= E_{(2,1,0)}, & f_{(1,2,0)} &= t^{\frac{1}{2}} T_1 E_{(2,1,0)}, & f_{(2,0,1)} &= t^{\frac{1}{2}} T_2 E_{(2,1,0)}, \\
 f_{(0,2,1)} &= t^{\frac{2}{2}} T_1 T_2 E_{(2,1,0)}, & f_{(1,0,2)} &= t^{\frac{2}{2}} T_2 T_1 E_{(2,1,0)}, & f_{(0,1,2)} &= t^{\frac{3}{2}} T_1 T_2 T_1 E_{(2,1,0)},
 \end{aligned}$$

then

$$\begin{aligned}
 gf_{(2,1,0)} &= gE_{(2,1,0)} = T_1 T_2 (T_2^{-1} T_1^{-1} g) E_{(2,1,0)} = T_1 T_2 Y_3 E_{(2,1,0)} = q^{-0} t^1 T_1 T_2 E_{(2,1,0)} = f_{(0,2,1)}, \\
 gf_{(1,2,0)} &= g t^{\frac{1}{2}} T_1 E_{(2,1,0)} = t^{\frac{1}{2}} T_2 g E_{(2,1,0)} = t^{\frac{1}{2}} T_2 t T_1 T_2 E_{(2,1,0)} = f_{(0,1,2)}, \\
 gf_{(2,0,1)} &= g t^{\frac{1}{2}} T_2 E_{(2,1,0)} = t^{\frac{1}{2}} T_1 T_1^{-1} g T_2 E_{(2,1,0)} = t^{\frac{1}{2}} T_1 Y_2 E_{(2,1,0)} = t^{\frac{1}{2}} T_1 q^{-1} t^{-1+1} E_{(2,1,0)} = q^{-1} f_{(1,2,0)}, \\
 gf_{(0,2,1)} &= g t^{\frac{2}{2}} T_1 T_2 E_{(2,1,0)} = t^{\frac{2}{2}} T_2 g T_2 E_{(2,1,0)} = t^{\frac{2}{2}} T_2 T_1 q^{-1} t^0 E_{(2,1,0)} = q^{-1} f_{(1,0,2)}, \\
 gf_{(1,0,2)} &= t^{\frac{2}{2}} g T_2 T_1 E_{(2,1,0)} = t^{\frac{2}{2}} Y_1 E_{(2,1,0)} = t^{\frac{2}{2}} q^{-2} t^{-2+1} E_{(2,1,0)} = q^{-2} f_{(2,1,0)}, \\
 gf_{(0,1,2)} &= t^{\frac{3}{2}} g T_1 T_2 T_1 E_{(2,1,0)} = t^{\frac{3}{2}} T_1 g T_2 T_1 E_{(2,1,0)} = t^{\frac{3}{2}} T_1 q^{-2} t^{-1} E_{(2,1,0)} = q^{-2} f_{(1,2,0)}.
 \end{aligned}$$

## 2 Boxes, arms, legs and counting terms

### 2.0.1 Common terminology.

$\mathbb{Z}_{\geq 0}^n = \{\mu = (\mu_1, \dots, \mu_n) \mid \mu_i \in \mathbb{Z}_{\geq 0}\}$	is the set of <i>weak compositions</i> ,
$\mathbb{Z}_{>0}^n = \{\mu = (\mu_1, \dots, \mu_n) \mid \mu_i \in \mathbb{Z}_{>0}\}$	is the set of <i>strong compositions</i> ,
$\mathbb{Z}^n = \{\mu = (\mu_1, \dots, \mu_n) \mid \mu_i \in \mathbb{Z}\}$	is the <i>lattice of integral weights</i> ,
$(\mathbb{Z}^n)^+ = \{(\mu_1, \dots, \mu_n) \in \mathbb{Z}^n \mid \mu_1 \geq \mu_2 \geq \dots \geq \mu_n\}$	is the set of <i>dominant integral weights</i> ,
$(\mathbb{Z}_{\geq 0}^n)^+ = \{(\mu_1, \dots, \mu_n) \in \mathbb{Z}_{\geq 0}^n \mid \mu_1 \geq \mu_2 \geq \dots \geq \mu_n\}$	is the set of <i>partitions of length <math>\leq n</math></i> .

### 2.0.2 Examples of box diagrams.

If  $\lambda = (5, 4, 4, 1, 0)$  and  $\mu = (0, 4, 5, 1, 4)$  then

$$dg(\lambda) = \begin{array}{c} | \\ \square \quad \square \quad \square \quad \square \quad \square \\ | \\ \square \quad \square \quad \square \quad \square \\ | \\ \square \end{array} \quad \text{and} \quad dg(\mu) = \begin{array}{c} | \\ \square \quad \square \quad \square \quad \square \quad \square \\ | \\ \square \quad \square \quad \square \quad \square \\ | \\ \square \end{array}$$

To conform to [Mac, p.2], we draw the box  $(i, j)$  as a square in row  $i$  and column  $j$  using the same coordinates as are usually used for matrices.

The *cylindrical coordinate* of the box  $(i, j)$  is the number  $i + nj$ .

### 2.0.3 Formulas for $\#Nleg_\mu(i, j)$ and $\#Narm_\mu(i, j)$

Using cylindrical coordinates for boxes define, for a box  $b \in dg(\mu)$ ,

$$\text{attack}_\mu(b) = \{b - 1, \dots, b - n + 1\} \cap \widehat{dg}(\mu), \quad (2.1)$$

$$Nleg_\mu(b) = (b + n\mathbb{Z}_{>0}) \cap dg(\mu) \quad \text{and} \quad (2.2)$$

$$Narm_\mu(b) = \{a \in \text{attack}_\mu(b) \mid \#Nleg_\mu(a) \leq \#Nleg_\mu(b)\}. \quad (2.3)$$

As in [HHL06, (15)], the number of elements of  $Nleg_\mu(i, j)$  and  $Narm_\mu(i, j)$  are

$$\#Nleg_\mu(i, j) = \#\{(i, j') \in dg(\mu) \mid j' > j\} = \mu_i - j,$$

$$\#Narm_\mu(i, j) = \#\{(i', j) \in dg(\mu) \mid i' < i \text{ and } \mu_{i'} \leq \mu_i\} + \#\{(i', j-1) \in \widehat{dg}(\mu) \mid i' > i \text{ and } \mu_{i'} < \mu_i\},$$

where  $\widehat{dg}(\mu) = dg(\mu) \cup \{(1, 0), \dots, (n, 0)\}$ .

### 2.0.4 Relating HHL arms and legs to Macdonald arms and legs.

If  $\mu$  is decreasing so that  $\mu_1 \geq \mu_2 \geq \dots \geq \mu_n$  then  $\mu$  is a partition and

$$\#Narm_\mu(i, j) = \mu'_{j-1} - i = \text{leg}_\mu(i, j-1) \quad \text{and} \quad \#Nleg_\mu(i, j) = \mu_i - j = \text{arm}_\mu(i, j).$$

If  $\mu$  is increasing so that  $\mu_1 \leq \mu_2 \leq \dots \leq \mu_n$  then  $w_0\mu = (\mu_n, \dots, \mu_1)$  is a partition and

$$\begin{aligned} \#Narm_\mu(i, j) &= (w_0\mu)'_{j-1} - (n-i) & \#Nleg_\mu(i, j) &= \mu_i - j = (w_0\mu)_{n-i} - j \\ &= \text{leg}_{w_0\mu}(n-i, j) & &= \text{arm}_{w_0\mu}(n-i, j) \end{aligned}$$

(see [HHL06, remarks before (17)] and [Hgl06, p. 136, remarks before Figure 6]).

### 2.0.5 Formulas for the number of alcove walks $\#AW_\mu^z$ and nonattacking fillings $\#NAF_\mu^z$

The motivation for computing  $\#AW_\mu^z$  and  $\#NAF_\mu^z$  is that the alcove walks formula and the nonattacking fillings formulas for the relative Macdonald polynomial  $E_\mu^z$  are, respectively,

$$E_\mu^z = \sum_{p \in AW_\mu^z} \text{wt}(p) \quad \text{and} \quad E_\mu^z = \sum_{T \in NAF_\mu^z} \text{wt}(T).$$

(see [GR21, Theorem 1.1]). The number of terms in the first formula is  $\#AW_\mu^z$  and the number of terms in the second formula is  $\#NAF_\mu^z$ .

For a box  $(i, j) \in dg(\mu)$  define  $u_\mu(i, j)$  by the equation

$$u_\mu(i, j) + 1 = n - \#\text{attack}_\mu(i, j).$$

Since  $\#\text{attack}_\mu(i, j) = \#\{i' \in \{1, \dots, i-1\} \mid \mu_{i'} \geq j\} + \#\{i' \in \{i+1, \dots, n\} \mid \mu_{i'} \geq j-1\}$  then

$$u_\mu(i, j) = \#\{i' \in \{1, \dots, i-1\} \mid \mu_{i'} < j \leq \mu_i\} + \#\{i' \in \{i+1, \dots, n\} \mid \mu_{i'} < j-1 < \mu_i\}.$$

Let  $\mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}_{\geq 0}^n$  and  $z \in S_n$ . By [GR21, Proposition (2.2)] and the definition of alcove walks and nonattacking fillings in [GR21, (1.11) and (1.7)],

$$\#AW_\mu^z = 2^{\ell(u_\mu)} = \prod_{(i,j) \in \mu} 2^{u_\mu(i,j)} \quad \text{and} \quad \#NAF_\mu^z = \prod_{(i,j) \in \mu} (u_\mu(i, j) + 1). \quad (2.4)$$

(The right hand side does not depend on the choice of  $z$ .) For example (as in [CMW18, Table 1]),

$$\#NAF_{(4,3,3,3,2,2,1,1,0,0)}^z = \left( \begin{array}{c} 1 \cdot 3 \cdot 5 \cdot 7 \\ \cdot 1 \cdot 3 \cdot 5 \\ \cdot 1 \cdot 3 \cdot 5 \\ \cdot 1 \cdot 3 \cdot 5 \\ \cdot 1 \cdot 3 \\ \cdot 1 \cdot 3 \\ \cdot 1 \\ \cdot 1 \\ \cdot 1 \end{array} \right) = 3189375, \quad \text{for } z \in S_{10}.$$

## 2.1 The column strict tableaux formula for $P_\lambda$

Let  $\lambda$  and  $\mu$  be partitions such that  $\lambda \supseteq \mu$  and  $\lambda/\mu$  is a horizontal strip. Following [Mac, Ch. VI §7 Ex. 2(b)], define

$$\psi_{\lambda/\mu} = \prod_{1 \leq i < j \leq \ell(\mu)} \frac{(q^{\mu_i - \mu_j} t^{j-i+1}; q)_\infty (q^{\lambda_i - \lambda_{j+1}} t^{j-i+1}; q)_\infty (q^{\lambda_i - \mu_j + 1} t^{j-i}; q)_\infty (q^{\mu_i - \lambda_{j+1} + 1} t^{j-i}; q)_\infty}{(q^{\mu_i - \mu_j + 1} t^{j-i}; q)_\infty (q^{\lambda_i - \lambda_{j+1} + 1} t^{j-i}; q)_\infty (q^{\lambda_i - \mu_j} t^{j-i+1}; q)_\infty (q^{\mu_i - \lambda_{j+1}} t^{j-i+1}; q)_\infty}.$$

where the infinite product  $(x; q)_\infty = (1-x)(1-xq)(1-xq^2)\dots$ . A *column strict tableau* of shape  $\lambda$  is a filling  $T: dg(\lambda) \rightarrow \{1, \dots, n\}$  such that

$$T(i, j) \leq T(i, j+1) \quad \text{and} \quad T(i, j) < T(i+1, j).$$

For a column strict tableau  $T$  define

$$\psi_T = \prod_{i=1}^r \psi_{\lambda^{(i)}/\lambda^{(i-1)}} \quad \text{where} \quad \lambda^{(i)} = \{u \in dg(\lambda) \mid T(u) \leq i\}.$$

Then [Mac, Ch. VI (7.13')] gives

$$P_\lambda = \sum_T \psi_T x^T, \quad \text{where} \quad x^T = x_1^{\#(1s \text{ in } T)} \cdots x_n^{\#(ns \text{ in } T)}. \quad (2.5)$$

By [Mac, Ch. 1 §3 Ex. 4], this formula for  $P_\lambda$  has

$$\prod_{b \in \lambda} \frac{n + c(b)}{h(b)} \quad \text{terms, where} \quad \begin{aligned} c(b) &\text{ is the content of the box } b, \\ h(b) &\text{ is the hook length at the box } b. \end{aligned}$$

### 2.1.1 Comparing numbers of terms in formulas for $P_\lambda$ .

Let  $\lambda = (\lambda_1, \dots, \lambda_n)$  be a partition and write  $\lambda = (0^{m_0} 1^{m_1} 2^{m_2} \dots)$  so that  $m_i$  is the number of rows of  $\lambda$  of length  $i$ . Then number of elements of the orbit  $S_n\lambda$  (the number of rearrangements of  $\lambda$ ) is

$$\text{Card}(S_n\lambda) = \frac{n!}{m_\lambda!}, \quad \text{where} \quad m_\lambda! = m_0! m_1! m_2! \dots.$$

By (1.5), the symmetric Macdonald polynomial is given by  $P_\lambda = \sum_{\nu \in S_n\lambda} E_\lambda^z$ , and using the alcove walks formula for  $E_\lambda^z$  and the nonattacking fillings formulas for  $E_\lambda^z$  provide formulas for  $P_\lambda$  with

$$\frac{n!}{m_\lambda!} \cdot \#\text{AW}_\lambda^z \text{ terms,} \quad \text{and} \quad \frac{n!}{m_\lambda!} \cdot \#\text{NAF}_\lambda^z \text{ terms,} \quad \text{respectively.}$$

Alternatively, by Proposition 1.1, there is a constant (*const*) such that

$$P_\lambda = (\text{const}) \sum_{\nu \in S_n\lambda} E_{\text{rev}(\lambda)}^z, \quad \text{where} \quad \begin{cases} \text{if } \lambda = (\lambda_1, \lambda_2, \dots, \lambda_k, 0, \dots, 0) \text{ with } \lambda_k \neq 0 \\ \text{then } \text{rev}(\lambda) = (\lambda_k, \dots, \lambda_2, \lambda_1, 0, \dots, 0). \end{cases}$$

Then using the alcove walks formula for  $E_{\text{rev}(\lambda)}^z$  and the nonattacking fillings formulas for  $E_{\text{rev}(\lambda)}^z$  provide formulas for  $P_\lambda$  with

$$\frac{n!}{m_\lambda!} \cdot \#\text{AW}_{\text{rev}(\lambda)}^z \text{ terms,} \quad \text{and} \quad \frac{n!}{m_\lambda!} \cdot \#\text{NAF}_{\text{rev}(\lambda)}^z \text{ terms,} \quad \text{respectively.}$$

Let  $\lambda$  be a partition. Let  $\lambda' = (\lambda'_1, \dots, \lambda'_k)$  be the conjugate partition to  $\lambda$  so that  $\lambda'_j$  is the length of the  $j$ th column of  $\lambda$ . For  $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_k, 0, \dots, 0)$  with  $\lambda_k \neq 0$  let  $\text{rev}(\lambda) = (\lambda_k, \dots, \lambda_2, \lambda_1, 0, \dots, 0)$ . Then  $u_\lambda(i, 1) = u_{\text{rev}(\lambda)}(i, 1) = 0$  and if  $j > 1$  then  $u_\lambda(i, j) = n - \lambda'_{j-1}$  and  $u_{\text{rev}(\lambda)}(i, j) = n - \lambda'_j$ . Thus

$$\#\text{AW}_\lambda = \prod_{\substack{(i,j) \in \lambda \\ j > 1}} 2^{n - \lambda'_{j-1}}, \quad \#\text{NAF}_\lambda = \prod_{\substack{(i,j) \in \lambda \\ j > 1}} (n - \lambda'_{j-1} + 1), \quad \#\text{NAF}_{\text{rev}(\lambda)} = \prod_{\substack{(i,j) \in \lambda \\ j > 1}} (n - \lambda'_j + 1),$$

and

$$t(\lambda) = n! \cdot \prod_{\substack{(i,j) \in \lambda \\ j > 1}} (n - \lambda'_{j-1} + 1), \quad c(\lambda) = \prod_{\substack{(i,j) \in \lambda \\ j > 1}} \frac{2^{n - \lambda'_{j-1}}}{n - \lambda'_{j-1} + 1}, \quad r(\lambda) = \prod_{\substack{(i,j) \in \lambda \\ j > 1}} \frac{n - \lambda'_j + 1}{n - \lambda'_{j-1} + 1}$$

are formulas for the values provided in the table in [Len08, end of §3] (Lenart assumes that the parts of  $\lambda$  are distinct so that  $m_\lambda! = 1$ ). For example, if  $\lambda = (5, 4, 2, 1, 0)$  as in the last row of Lenart's table then

$$t(\lambda) = 5! \cdot \left( \begin{array}{c} 1 \cdot 2 \cdot 3 \cdot 4 \cdot 4 \\ 1 \cdot 2 \cdot 3 \cdot 4 \\ 1 \cdot 2 \\ 1 \end{array} \right), \quad c(\lambda) = \frac{\left( \begin{array}{c} 2^0 \cdot 2^1 \cdot 2^2 \cdot 2^3 \cdot 2^3 \\ 2^0 \cdot 2^1 \cdot 2^2 \cdot 2^3 \\ 2^0 \cdot 2^1 \\ 2^0 \end{array} \right)}{\left( \begin{array}{c} 1 \cdot 2 \cdot 3 \cdot 4 \cdot 4 \\ 1 \cdot 2 \cdot 3 \cdot 4 \\ 1 \cdot 2 \\ 1 \end{array} \right)}, \quad r(\lambda) = \frac{\left( \begin{array}{c} 1 \\ 1 \cdot 3 \\ 1 \cdot 3 \cdot 4 \cdot 4 \\ 1 \cdot 3 \cdot 4 \cdot 4 \cdot 5 \\ 1 \cdot 2 \cdot 3 \cdot 4 \cdot 4 \\ 1 \cdot 2 \cdot 3 \cdot 4 \\ 1 \cdot 2 \\ 1 \end{array} \right)}{\left( \begin{array}{c} 1 \cdot 2 \cdot 3 \cdot 4 \cdot 4 \\ 1 \cdot 2 \cdot 3 \cdot 4 \\ 1 \cdot 2 \\ 1 \end{array} \right)},$$

so that  $t(\lambda) = 552960$ ,  $c(\lambda) = \frac{128}{9} \approx 14.222$  and  $r(\lambda) = \frac{15}{2} = 7.5$ . To compare this with the number of column strict tableaux of shape  $\lambda = (5, 4, 2, 1, 0)$  (the number of terms in the formula for  $P_\lambda$  in (2.5)),

$$\prod_{b \in \lambda} \frac{n + c(b)}{h(b)} = \frac{\begin{pmatrix} 5 \cdot 6 \cdot 7 \cdot 8 \cdot 9 \\ 4 \cdot 5 \cdot 6 \cdot 7 \\ 3 \cdot 4 \\ 2 \\ 8 \cdot 6 \cdot 4 \cdot 3 \cdot 1 \\ 6 \cdot 4 \cdot 2 \cdot 1 \\ 3 \cdot 1 \\ 1 \end{pmatrix}}{\begin{pmatrix} 5 \cdot 7 \cdot 3 \cdot 5 \cdot 7 \\ 3675 \end{pmatrix}} = 3675, \quad \text{and} \quad \frac{552960}{3675} = 150.465.$$

### 3 Converting fillings and alcove walks to paths and pipe dreams

#### 3.0.1 Hyperplanes and alcoves

Let  $\mathbb{R}^n = \mathfrak{a}_\mathbb{R}^* = \mathbb{R}\varepsilon_1 + \cdots + \mathbb{R}\varepsilon_n$ . For  $i, j, k \in \{1, \dots, n\}$  with  $i < j$  and  $\ell \in \mathbb{Z}$  define

$$\begin{aligned} \mathfrak{a}^{\varepsilon_i^\vee - \varepsilon_j^\vee + \ell K} &= \{(\mu_1, \dots, \mu_n) \in \mathbb{R}^n \mid \mu_i - \mu_j = -\ell\}, \quad \text{and} \\ \mathfrak{a}^{\varepsilon_k^\vee + \ell K} &= \{(\mu_1, \dots, \mu_n) \in \mathbb{R}^n \mid \mu_k = -\ell\}. \end{aligned} \tag{3.1}$$

The union of these hyperplanes is

$$\mathcal{H} = \{(\mu_1, \dots, \mu_n) \in \mathbb{R}^n \mid \text{if } i, j \in \{1, \dots, n\} \text{ and } i \neq j \text{ then } \mu_i \notin \mathbb{Z} \text{ and } \mu_i - \mu_j \notin \mathbb{Z}\}.$$

An *alcove* is a connected component of

$$\mathbb{R}^n - \mathcal{H}, \quad \text{the complement of the hyperplanes listed in (3.1).}$$

The *fundamental alcove* is

$$A_1 = \{\mu = (\mu_1, \dots, \mu_n) \in \mathbb{R}^n \mid \mu_1 - \mu_n \in \mathbb{R}_{>0} \text{ and if } i \in \{1, \dots, n\} \text{ then } \mu_i \in \mathbb{R}_{(-1,0)}\}.$$

For  $n = 2$ , some pictures of these hyperplanes and paths in  $\mathfrak{a}_\mathbb{R}^* \cong \mathbb{R}^2$  are in section 3.0.8.

#### 3.0.2 Bijection $W \leftrightarrow W \cdot \frac{1}{n}\rho \leftrightarrow \{\text{alcoves}\}$

Let  $W$  be the group of  $n$ -periodic permutations and define an action of  $W_{GL_n}$  on  $\mathbb{R}^n$  by

$$\begin{aligned} \pi(\mu_1, \dots, \mu_n) &= (\mu_n + 1, \mu_1, \dots, \mu_n), \\ \text{and} \quad s_i(\mu_1, \dots, \mu_n) &= (\mu_1, \dots, \mu_{i-1}, \mu_{i+1}, \mu_i, \mu_{i+1}, \dots, \mu_n), \quad \text{for } i \in \{1, \dots, n-1\}. \end{aligned} \tag{3.2}$$

Let

$$\rho = (\frac{n-1}{2}, \frac{n-3}{2}, \dots, \frac{-(n-1)}{2}) = (n-1, n-2, \dots, 1, 0) - \frac{n-1}{2}(1, 1, \dots, 1). \tag{3.3}$$

Then the maps

$$\begin{array}{ccccccc} W & \longleftrightarrow & W \cdot \frac{1}{n}\rho & \longleftrightarrow & \{\text{alcoves}\} & & \text{are bijections,} \\ w & \mapsto & \frac{1}{n}w\rho & \mapsto & wA_1 & & \end{array} \tag{3.4}$$

and so we can identify  $W$  with the set of alcoves and with the orbit  $W \cdot \frac{1}{n}\rho$ . The statement in (3.4) holds because the stabilizer of  $\frac{1}{n}\rho$  under the action of  $W$  on  $\mathbb{R}^n$  is  $\{1\}$ .

### 3.0.3 Reflections in $W$ .

For any pair  $(j, k) \in \mathbb{Z} \times \mathbb{Z}$  with  $j \neq k$  define

$$s_{jk}(j) = k, \quad s_{jk}(k) = j, \quad s_{jk}(i) = i \text{ if } i \neq j \bmod n \text{ and } i \neq k \bmod n..$$

If  $i \in \{1, \dots, n-1\}$  and  $t_\mu v = ((\mu_1)_{v(1)}, (\mu_2)_{v(2)}, \dots, (\mu_n)_{v(n)})$  then

$$s_i t_\mu v = ((\mu_1)_{v(1)}, \dots, (\mu_{i-1})_{v(i-1)}, (\mu_{i+1})_{v(i+1)}, (\mu_i)_{v(i)}, (\mu_{i+2})_{v(i+2)}, \dots, (\mu_n)_{v(n)}),$$

so that, in extended one-line notation,  $s_i$  acts by switching the  $i$ th and  $(i+1)$ st components. The

hyperplane  $\mathfrak{a}^{\beta^\vee}$  between  $t_\mu v A_1$  and  $s_i t_\mu v A_1$  has root  $\beta^\vee = \varepsilon_{v(i+1)}^\vee - \varepsilon_{v(i)}^\vee + (\mu_i - \mu_{i+1})K$ .

### 3.0.4 Paths.

A *path* is a piecewise linear function  $\gamma: \mathbb{R}_{[0,a]} \rightarrow \mathbb{R}^n$ , where  $a \in \mathbb{R}_{>0}$  and  $\mathbb{R}_{[0,a]} = \{t \in \mathbb{R} \mid 0 \leq t \leq a\}$ . The *concatenation of paths*  $\gamma_1: \mathbb{R}_{[0,a]} \rightarrow \mathfrak{h}_\mathbb{R}^*$  and  $\gamma_2: \mathbb{R}_{[0,b]} \rightarrow \mathfrak{h}_\mathbb{R}^*$  is the path

$$\gamma_1 \gamma_2: \mathbb{R}_{[0,a+b]} \rightarrow \mathfrak{h}_\mathbb{R}^* \quad \text{given by} \quad (\gamma_1 \gamma_2)(t) = \begin{cases} \gamma_1(t), & \text{if } t \in \mathbb{R}_{[0,a]}, \\ \gamma_1(a) + \gamma_2(t-a), & \text{if } t \in \mathbb{R}_{[a,a+b]}. \end{cases}$$

### 3.0.5 Paths corresponding to nonattacking fillings.

The *straight line path to  $0 \rightarrow \varepsilon_i$*  is

$$\begin{aligned} x_i: \quad \mathbb{R}_{[0,1]} &\rightarrow \mathbb{R}^n \\ t &\mapsto t\varepsilon_i \end{aligned}$$

If  $T$  is a nonattacking filling of type  $(z, \mu)$  then the *word, or path, of  $T$*  is

$$\vec{x}_T = \prod_{u \in \mu} x_{T(u)} \quad \text{taken in increasing order of cylindrical coordinate.}$$

The path, or word,

$$\vec{x}_T = x_{i_1} x_{i_2} \cdots x_{i_\ell} \quad \text{is} \quad 0 \rightarrow \varepsilon_{i_1} \rightarrow (\varepsilon_{i_1} + \varepsilon_{i_2}) \rightarrow \cdots \rightarrow \varepsilon_{i_1} + \cdots + \varepsilon_{i_\ell}$$

as a sequence of straight line segments.

### 3.0.6 Paths corresponding to alcove walks.

Define paths  $\omega: \mathbb{R}_{[0,1]} \rightarrow \mathbb{R}^n$  and  $c_\alpha: \mathbb{R}_{[0,1]} \rightarrow \mathbb{R}^n$  and  $f_\alpha: \mathbb{R}_{[0,1]} \rightarrow \mathbb{R}^n$  by

$$\omega(t) = \frac{t}{n}(1, 1, \dots, 1), \quad c_\alpha(t) = t\alpha \quad \text{and} \quad f_\alpha(t) = \begin{cases} t\alpha, & \text{if } 0 \leq t \leq \frac{1}{2}, \\ (1-t)\alpha, & \text{if } \frac{1}{2} \leq t \leq 1. \end{cases}$$

Let  $\mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}_{\geq 0}^n$  and  $z \in S_n$ . Let  $s_\pi = \pi$  and let  $\vec{u}_\mu = s_{i_1} \cdots s_{i_r}$  be a reduced word for  $u_\mu$ . An *alcove walk* of type  $(z, \vec{u}_\mu)$  is

$$\text{a sequence } p = (p_0, p_1, \dots, p_r) \text{ of elements of } W \text{ such that} \tag{3.5}$$

$p_0 = z$ ; if  $s_{i_k} = \pi$  then  $p_k = p_{k-1}\pi$ ; and if  $s_{i_k} \neq \pi$  then  $p_k \in \{p_{k-1}, p_{k-1}s_{i_k}\}$ . The path corresponding to  $p$  is

$$\gamma_{\beta_1} \cdots \gamma_{\beta_\ell}, \quad \text{where} \quad \gamma_{\beta_j} = \begin{cases} f_{p_{k-1}\alpha_{i_k}}, & \text{if } p_k = p_{k-1}, \\ c_{p_{k-1}\alpha_{i_k}}, & \text{if } p_k = p_{k-1}s_{i_k}, \\ \omega, & \text{if } p_k = p_{k-1}\pi, \end{cases} \tag{3.6}$$

See §6.0.3 for pictures in  $\mathbb{R}^2$ , for  $n = 2$ . The pictures of paths for  $n = 3$  in sections 3.0.9 and 3.0.9 are projections from  $\mathbb{R}^3$  to the plane  $\{(\gamma_1, \gamma_2, \gamma_3) \in \mathbb{R}^3 \mid \gamma_1 + \gamma_2 + \gamma_3 = 0\}$ .

### 3.0.7 Pipe dreams corresponding to nonattacking fillings

Let  $\mu \in \mathbb{Z}_{\geq 0}^n$ . A *filling* of  $dg(\mu)$  is a function  $T: dg(\mu) \rightarrow \{1, \dots, n\}$ . If the filling is nonattacking, then it satisfies the *column distinct condition*,

$$\text{if } j \in \mathbb{Z}_{\geq 0} \text{ and } (i, j), (i', j) \in D \text{ then } T(i, j) \neq T(i', j), \quad (\text{CD})$$

and so the filling  $T$  can be converted into a *pipe dream*  $P: \{1, \dots, n\} \times \mathbb{Z}_{\geq 0} \rightarrow \{1, \dots, n\}$  by setting

$$P(k, j) = i \quad \text{if and only if} \quad T(i, j) = k, \quad (3.7)$$

and putting  $P(k, j) = 0$  if there does not exist  $i \in \{1, \dots, n\}$  such that  $T(i, j) = k$ . (This bijection is given in [BW19, (5.10)] and [CMW18, Definition A.6]. In [CMW18, Definition A.6] the pipe dreams are the *multiline queues* and the fillings are the Queue Tableaux and in [BW19, (5.10)] the pipe dreams are the  $\mu$ -legal configurations.) The column distinct condition on  $T$  is exactly the condition that  $P$  obtained in this way is a function.

For example,

$$\begin{array}{c|ccc} 1 & 1 & 1 \\ \hline 2 & 2 & 2 \\ 3 & 3 \end{array} \quad \begin{array}{c|cc} 1 & 1 & 1 \\ \hline 2 & 2 & 3 \\ 3 & 3 \end{array} \quad \begin{array}{c|cc} 1 & 1 & 3 \\ \hline 2 & 2 & 1 \\ 3 & 3 \end{array} \quad \begin{array}{c|cc} 1 & 1 & 3 \\ \hline 2 & 2 & 2 \\ 3 & 3 \end{array}$$

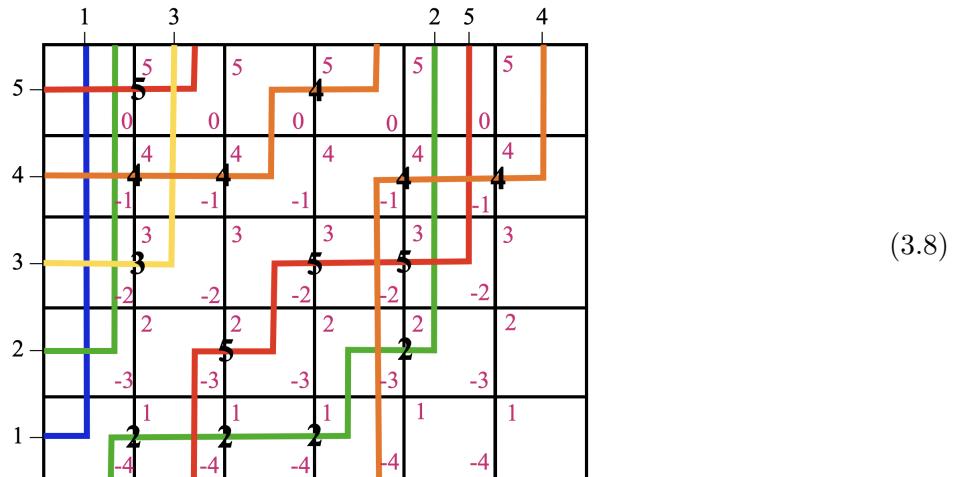

are the 4 nonattacking fillings of  $\mu = (2, 2, 0)$ . Converting these to pipe dreams gives

$$\left( \begin{array}{c|cc} 1 & 1 & 1 \\ \hline 2 & 2 & 2 \\ 3 & 0 & 0 \end{array} \right) \quad \left( \begin{array}{c|cc} 1 & 1 & 1 \\ \hline 2 & 2 & 0 \\ 3 & 0 & 2 \end{array} \right) \quad \left( \begin{array}{c|cc} 1 & 1 & 2 \\ \hline 2 & 2 & 1 \\ 3 & 0 & 0 \end{array} \right) \quad \left( \begin{array}{c|cc} 1 & 1 & 0 \\ \hline 2 & 2 & 2 \\ 3 & 0 & 1 \end{array} \right)$$

The example in [BW19, Figure 5] has

$$\text{filling} \quad \begin{array}{c|cccc} 1 & & & & \\ \hline 2 & 1 & 1 & 1 & 2 \\ 3 & 3 & & & \\ \hline 4 & 4 & 4 & 5 & 4 & 4 \\ 5 & 5 & 2 & 3 & 3 & \end{array} \quad \text{with corresponding pipe dream} \quad \left( \begin{array}{c|ccccc} 1 & 2 & 2 & 2 & 0 & 0 \\ \hline 2 & 0 & 5 & 0 & 2 & 0 \\ 3 & 3 & 0 & 5 & 5 & 0 \\ 4 & 4 & 4 & 0 & 4 & 4 \\ 5 & 5 & 0 & 4 & 0 & 0 \end{array} \right)$$

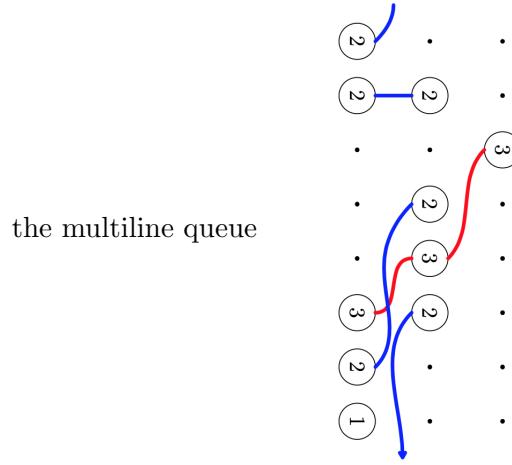

and the picture of this pipe dream from [BW19, Figure 5] is

([BW19] index rows bottom to top instead of top to bottom). The example in [CMW18, Figures 3 and 12] has

$$\text{nonattacking filling } T = \begin{array}{c|ccc} 6 & 6 & 5 & 3 \\ 1 & 1 & 6 \\ 2 & 2 & 2 \\ 7 & 7 & 4 \\ 8 & 8 \\ 3 \\ 4 \\ 5 \end{array} \quad \text{and pipe dream } P = \begin{pmatrix} 2 & 2 & 0 & 0 \\ 3 & 3 & 3 & 0 \\ 6 & 0 & 0 & 1 \\ 7 & 0 & 4 & 0 \\ 8 & 0 & 1 & 0 \\ 1 & 1 & 2 & 0 \\ 4 & 4 & 0 & 0 \\ 5 & 5 & 0 & 0 \end{pmatrix}$$

and the picture of this pipe dream (multiline queue in the terminology of [CMW18]) from [CMW18, Fig. 3] is

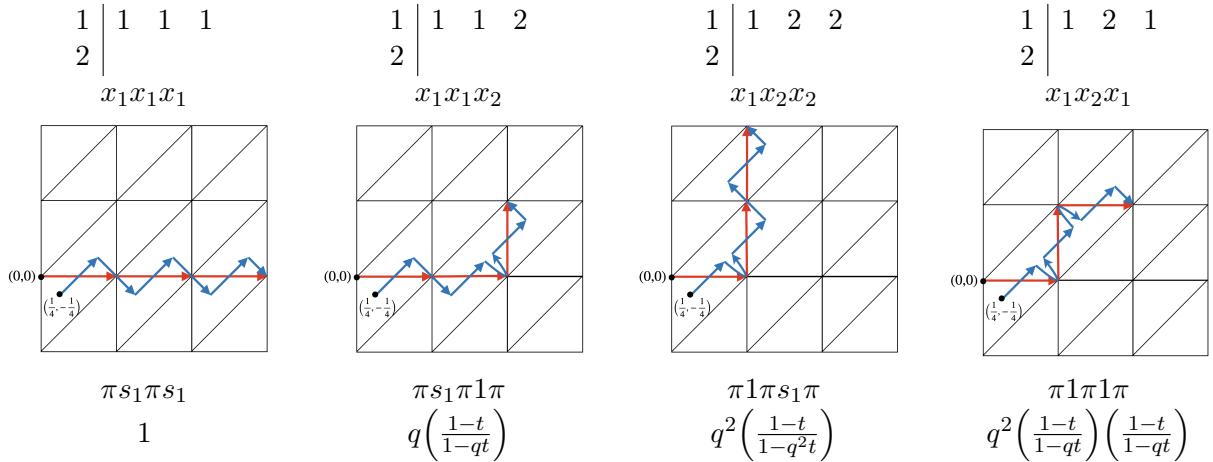

### 3.0.8 Alcove walks, nonattacking fillings and paths for $E_{(3,0)}$

The explicit expansion of  $E_{(3,0)}$  is

$$E_{(3,0)} = x_1^3 + \left(\frac{1-t}{1-q^2t}\right)q^2x_1x_2^2 + \left(\left(\frac{1-t}{1-qt}\right)q + \left(\frac{1-t}{1-q^2t}\right)\left(\frac{1-t}{1-qt}\right)q^2\right)x_1^2x_2.$$

The nonattacking fillings, words, paths, alcove walks and corresponding weights for  $E_{(3,0)}$  are

The first row contains the nonattacking fillings. The second row contains the words of the nonattacking fillings. The red paths are the paths corresponding to the words of the nonattacking fillings, and the blue paths are the paths corresponding to the alcove walks. We used a shortened notation for the alcove walks so that

$$\begin{aligned} \pi s_1 \pi s_1 \pi & \text{ represents the alcove walk } (1, \pi, \pi s_1, \pi s_1 \pi, \pi s_1 \pi s_1, \pi s_1 \pi s_1 \pi), \\ \pi s_1 \pi 1 \pi & \text{ represents the alcove walk } (1, \pi, \pi s_1, \pi s_1 \pi, \pi s_1 \pi, \pi s_1 \pi^2), \\ \pi 1 \pi s_1 \pi & \text{ represents the alcove walk } (1, \pi, \pi, \pi^2, \pi^2 s_1, \pi^2 s_1 \pi), \\ \pi 1 \pi 1 \pi & \text{ represents the alcove walk } (1, \pi, \pi, \pi^2, \pi^2, \pi^3). \end{aligned}$$

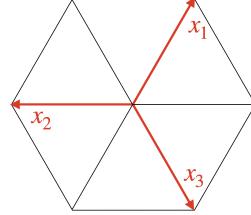

The last row contains the weights of the alcove walks (which are the same as the weights of the nonattacking fillings to illustrate that the factors of the form  $\left(\frac{1-t}{1-q^at^b}\right)$  are in bijection with the folds of the blue path).

### 3.0.9 Alcove walks, nonattacking fillings and pipe dreams for $E_{(2,0,1)}$

In the orthogonal projection from  $\mathbb{R}^3$  to the plane

$$\{(\gamma_1, \gamma_2, \gamma_3) \in \mathbb{R}^3 \mid \gamma_1 + \gamma_2 + \gamma_3 = 0\}$$

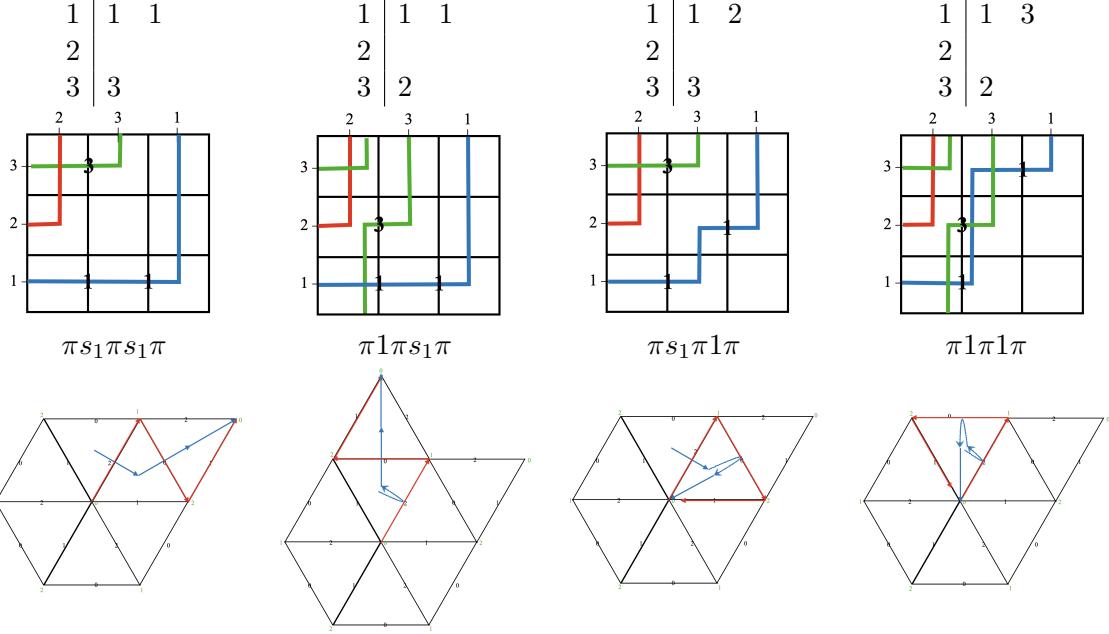

(so that we can draw 2-dimensional pictures), the straight line paths  $x_1, x_2, x_3$  to  $\varepsilon_1, \varepsilon_2, \varepsilon_3$ , respectively, are pictured as

The explicit expansion of  $E_{(2,0,1)}$  is

$$E_{(2,0,1)} = x_1 x_3 x_1 + \frac{1-t}{1-qt} x_1 x_2 x_1 + qt \frac{1-t}{1-qt^2} x_1 x_3 x_2 + q \frac{1-t}{1-qt} \frac{1-t}{1-qt^2} x_1 x_2 x_3$$

The nonattacking fillings, words, paths, alcove walks and corresponding weights for  $E_{(2,0,1)}$  are

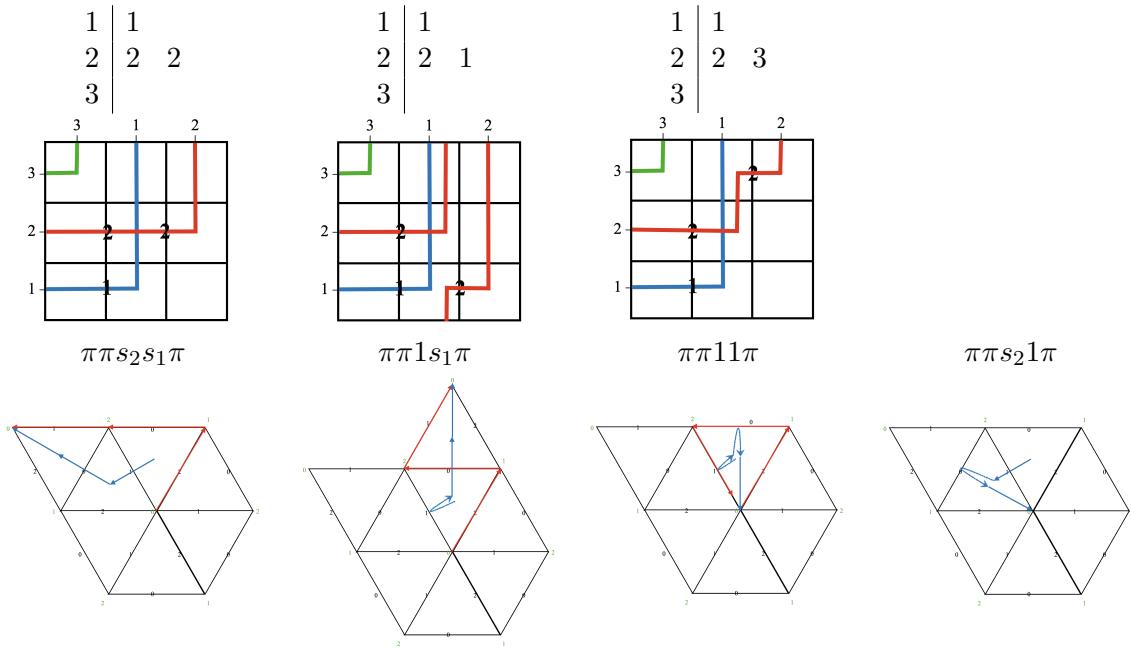

where we have used the same shortened notation for alcove walks as in the table in Section 3.0.8. The sections of type  $\omega$  in the paths corresponding to the alcove walks (see (3.6)) are not visible in these pictures since the pictures are in a projection orthogonal to the direction of  $\omega$ .

### 3.0.10 Alcove walks, nonattacking fillings and pipe dreams for $E_{(1,2,0)}$

The explicit expansion of  $E_{(1,2,0)}$  is

$$E_{(1,2,0)} = x_1 x_2 x_2 + \frac{1-t}{1-qt} x_1 x_2 x_1 + q \frac{(1-qt^2)}{(1-qt)} \frac{(1-t)}{(1-qt^2)} x_1 x_2 x_3$$

The nonattacking fillings, words, paths, alcove walks and corresponding weights for  $E_{(1,2,0)}$  are

where we have used the same shortened notation for alcove walks as in the table in Section 3.0.8. The sections of type  $\omega$  in the paths corresponding to the alcove walks (see (3.6)) are not visible in these pictures since the pictures are in a projection orthogonal to the direction of  $\omega$ . For this example, there are 4 alcove walks and 3 nonattacking fillings.

## 4 Reduced words and inversions

### 4.0.1 Examples of the inversion set $\text{Inv}(w)$ .

Define  $n$ -periodic permutations  $\pi$  and  $s_0, s_1, \dots, s_{n-1} \in W$  by

$$\pi(i) = i + 1, \quad \text{for } i \in \mathbb{Z}, \quad (4.1)$$

$$\begin{aligned} s_i(i) &= i + 1, \\ s_i(i+1) &= i, \end{aligned} \quad \text{and} \quad s_i(j) = j \quad \text{for } j \in \{0, 1, \dots, i-1, i+2, \dots, n-1\}. \quad (4.2)$$

An *inversion* of a bijection  $w: \mathbb{Z} \rightarrow \mathbb{Z}$  is

$$(j, k) \in \mathbb{Z} \times \mathbb{Z} \quad \text{with} \quad j < k \text{ and } w(j) > w(k).$$

and the affine root corresponding to an inversion

$$(i, k) = (i, j + \ell n) \quad \text{with } i, j \in \{1, \dots, n\} \text{ and } \ell \in \mathbb{Z}, \quad \text{is} \quad \beta^\vee = \varepsilon_i^\vee - \varepsilon_j^\vee + \ell K. \quad (4.3)$$

Let  $n = 3$ . The element

$$w = s_1 s_2 \quad \text{has} \quad w(1) = 2, \quad w(2) = 3, \quad w(3) = 1,$$

and  $w(1) > w(3)$  and  $w(2) > w(3)$  and

$$\text{Inv}(w) = \{\alpha_2^\vee, s_2 \alpha_1^\vee\} = \{\varepsilon_2^\vee - \varepsilon_3^\vee, \varepsilon_1^\vee - \varepsilon_3^\vee\}.$$

The element

$$w = s_2 s_1 \quad \text{has} \quad w(1) = 3, \quad w(2) = 1, \quad w(3) = 2,$$

and  $w(1) > w(2)$  and  $w(1) > w(3)$  and

$$\text{Inv}(w) = \{\alpha_1^\vee, s_1 \alpha_2^\vee\} = \{\varepsilon_1^\vee - \varepsilon_2^\vee, \varepsilon_1^\vee - \varepsilon_3^\vee\}.$$

These are examples of [GR21, (2.11)].

### 4.0.2 Relations in the affine Weyl group $W$

The following relations are useful when working with  $n$ -periodic permutations.

**Proposition 4.1.** *Then*

$$s_0 = t_{\varepsilon_1^\vee - \varepsilon_n^\vee} s_{n-1} \cdots s_2 s_1 s_2 \cdots s_{n-1}, \quad t_{\varepsilon_1^\vee} = \pi s_{n-1} \cdots s_2 s_1, \quad (4.4)$$

$$\text{and} \quad t_{\varepsilon_{i+1}^\vee} = s_i t_{\varepsilon_i^\vee} s_i, \quad \pi s_i \pi^{-1} = s_{i+1}, \quad (4.5)$$

for  $i \in \{1, \dots, n-1\}$ .

*Proof.* Proof of (4.4): If  $i \notin \{1, n\}$

$$t_{\varepsilon_1^\vee - \varepsilon_n^\vee} s_{n-1} \cdots s_2 s_1 s_2 \cdots s_{n-1}(i) t_{\varepsilon_1^\vee - \varepsilon_n^\vee}(i) = i = s_0(i).$$

If  $i = 1$  then

$$t_{\varepsilon_1^\vee - \varepsilon_n^\vee} s_{n-1} \cdots s_2 s_1 s_2 \cdots s_{n-1}(1) = t_{\varepsilon_1^\vee - \varepsilon_n^\vee}(n) = n - n = 0 = s_0(1),$$

and, if  $i = n$  then

$$t_{\varepsilon_1^\vee - \varepsilon_n^\vee} s_{n-1} \cdots s_2 s_1 s_2 \cdots s_{n-1}(n) = t_{\varepsilon_1^\vee - \varepsilon_n^\vee}(1) = 1 + n = s_0(n),$$

For  $i \in \{2, \dots, n\}$

$$\pi s_{n-1} \cdots s_1(i) = \pi(i-1) = i = t_{\varepsilon_1}(i), \quad \text{and} \quad \pi s_{n-1} \cdots s_1(1) = \pi(n) = n+1 = t_{\varepsilon_1}(1).$$

Proof of (4.5):

$$\begin{aligned} s_i t_{\varepsilon_i^\vee} s_i(i) &= s_i t_{\varepsilon_i^\vee}(i+1) = s_i(i+1) = i = t_{\varepsilon_{i+1}^\vee}(i), \\ s_i t_{\varepsilon_i^\vee} s_i(i+1) &= s_i t_{\varepsilon_i^\vee}(i) = s_i(i+n) = i+1+n, = t_{\varepsilon_{i+1}^\vee}(i+1), \\ s_i t_{\varepsilon_i^\vee} s_i(j) &= s_i t_{\varepsilon_i^\vee}(j) = s_i(j) = j = t_{\varepsilon_{i+1}^\vee}(j), \quad \text{if } j \in \{1, \dots, n\} \text{ and } j \notin \{i, i+1\}. \end{aligned}$$

Finally,

$$\begin{aligned} \pi s_i \pi^{-1}(i) &= \pi s_i(i-1) = \pi(i) = i+1 = s_{i+1}(i), \quad \text{and} \\ \pi s_i \pi^{-1}(i+1) &= \pi s_i(i) = \pi(i+1) = i+2 = s_{i+1}(i+1). \end{aligned}$$

□

#### 4.0.3 The “affine Weyl group” and the “extended affine Weyl group”

The type  $GL_n$  affine Weyl group  $W$  is generated by  $s_1, \dots, s_n$  and  $\pi$ . The group  $W$  contains also  $s_0$  and all the elements  $t_\mu$  for  $\mu \in \mathbb{Z}^n$ . The *projection homomorphism* is the group homomorphism  $\bar{\phantom{x}} : W \rightarrow S_n$  given by

$$\bar{t_\mu v} = v, \quad \text{for } \mu \in \mathbb{Z}^n \text{ and } v \in S_n. \quad (4.6)$$

The *type  $PGL_n$ -affine Weyl group* is the subgroup  $W_{PGL_n}$  generated by  $s_0, s_1, \dots, s_{n-1}$ .

$$\begin{aligned} W_{PGL_n} &= \{t_\mu v \mid \mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}^n \text{ with } \mu_1 + \cdots + \mu_n = 0 \text{ and } v \in S_n\}, \quad \text{and} \\ W_{GL_n} &= W = \{t_\mu v \mid \mu \in \mathbb{Z}^n, v \in S_n\} = \{\pi^h w \mid h \in \mathbb{Z}, w \in W_{PGL_n}\}. \end{aligned}$$

Then

$$W_{GL_n} = \mathbb{Z}^n \rtimes S_n = \Omega \ltimes W_{PGL_n}, \quad \text{where } \Omega = \{\pi^h \mid h \in \mathbb{Z}\} \text{ with } \Omega \cong \mathbb{Z}.$$

The symbols  $\ltimes$  and  $\rtimes$  are brief notations whose purpose is to indicate that the relations in (4.5) hold.

The group  $W_{PGL_n}$  is also a quotient of  $W_{GL_n}$ , by the relation  $\pi = 1$ . The *type  $SL_n$  affine Weyl group* is the quotient of  $W_{GL_n}$  by the relation  $\pi^n = 1$ . This is equivalent to putting a relation requiring

$$t_\mu = t_\nu \quad \text{if } \mu_i = \nu_i \pmod{n} \text{ for } i \in \{1, \dots, n\}.$$

As explained in [St67, Ch. 3, Exercise after Corollary 5], there is a Chevalley group  $G_d$  for each positive integer  $d$  dividing  $n$ . The group  $G_d$  is a central extension of  $PGL_n$  by  $\mathbb{Z}/d\mathbb{Z}$  (so that  $G_1 = PGL_n$  and  $G_n = SL_n$ ). Each of these groups  $G_d$  has an affine Weyl group  $W_{G_d}$ . The group  $W_{G_d}$  is the quotient of  $W_{GL_n}$  by the relation  $\pi^d = 1$ , and is an extension of  $W_{PGL_n}$  by  $\mathbb{Z}/d\mathbb{Z}$ . The group  $W_{PGL_n}$  is sometimes called the “affine Weyl group of type  $A$ ” and the groups  $W_{GL_n}$  and  $W_{G_d}$  for  $d \neq 1$  are sometimes called the “extended affine Weyl groups of type  $A$ ”. We prefer the more specific terminologies “affine Weyl group of type  $PGL_n$ ” for  $W_{PGL_n}$ , “affine Weyl group of type  $SL_n$ ” for  $W_{SL_n}$ , “affine Weyl group of type  $GL_n$ ” for  $W_{GL_n}$ , and “affine Weyl group of type  $PGL_n \ltimes (\mathbb{Z}/d\mathbb{Z})$ ” for  $W_{G_d}$  (the symbol  $\ltimes$  indicates a central extension).

#### 4.0.4 The elements $u_\mu, v_\mu, z_\mu$ and $t_\mu$ .

Let  $\mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}_{\geq 0}^n$  and let  $u_\mu$  be the minimal length  $n$ -periodic permutation such that

$$u_\mu(0, 0, \dots, 0) = (\mu_1, \dots, \mu_n).$$

Let  $\lambda = (\lambda_1, \dots, \lambda_n)$  be the weakly decreasing rearrangement of  $\mu$  and let

$$\begin{aligned} z_\mu &\in S_n \quad \text{be minimal length such that } z_\mu \lambda = \mu, \quad \text{and let} \\ v_\mu &\in S_n \quad \text{be minimal length such that } v_\mu \mu \text{ is weakly increasing.} \end{aligned}$$

Let  $t_\mu: \mathbb{Z} \rightarrow \mathbb{Z}$  be the  $n$ -periodic permutation determined by

$$t_\mu(1) = 1 + n\mu_1, \quad t_\mu(2) = 2 + n\mu_2, \quad \dots, \quad t_\mu(n) = n + n\mu_n. \quad (4.7)$$

#### 4.0.5 Relating $u_\mu, v_\mu, z_\mu$ to $u_\lambda, v_\lambda, z_\lambda$ .

Let  $\lambda = (\lambda_1, \dots, \lambda_n) \in \mathbb{Z}^n$  with  $\lambda_1 \geq \dots \geq \lambda_n$ . Let  $S_\lambda = \{w \in S_n \mid w\lambda = \lambda\}$  be the stabilizer of  $\lambda$  in  $S_n$ . Let

$$\begin{aligned} w_0 &\text{ be the longest element in } S_n, & w_0 = w^\lambda w_\lambda \quad \text{and} \\ w_\lambda &\text{ the longest length element in } S_\lambda, \text{ and} & \text{so that} \\ w^\lambda &\text{ the minimal length element in the coset } w_0 S_\lambda, & \binom{n}{2} = \ell(w_0) = \ell(w^\lambda) + \ell(w_\lambda). \end{aligned}$$

Let  $\mu \in \mathbb{Z}^n$  and let  $\lambda$  be the decreasing rearrangement of  $\lambda$ . Let  $z_\mu \in S_n$  be minimal length such that  $\mu = z_\mu \lambda$ . Then  $z_\lambda = 1$ ,

$$t_\mu = u_\mu v_\mu = (z_\mu u_\lambda) v_\mu \quad \text{and} \quad t_\lambda = u_\lambda v_\lambda = u_\lambda (w^\lambda)^{-1}, \quad \text{with}$$

$$\ell(t_\mu) = \ell(u_\mu) + \ell(v_\mu) = \ell(z_\mu) + \ell(u_\lambda) + \ell(v_\mu) \quad \text{and} \quad \ell(t_\lambda) = \ell(u_\lambda) + \ell((w^\lambda)^{-1}).$$

Using that  $z_\mu t_\lambda z_\mu^{-1} = t_{z_\mu \lambda} = t_\mu$  gives that the elements  $u_\mu$  and  $v_\mu$  are given in terms of  $z_\mu$ ,  $u_\lambda$  and  $w^\lambda$  by

$$u_\mu = z_\mu u_\lambda \quad \text{and} \quad v_\mu = v_\lambda z_\mu^{-1} = (w^\lambda)^{-1} z_\mu^{-1} = (z_\mu w^\lambda)^{-1} = (z_\mu w_0 w_\lambda)^{-1} = w_\lambda w_0 z_\mu^{-1},$$

since  $v_\lambda = (w^\lambda)^{-1}$  and  $v_\lambda = v_\mu z_\mu$  with  $\ell((w_\lambda)^{-1}) = \ell(v_\lambda) = \ell(v_\mu) + \ell(z_\mu)$ .

#### 4.0.6 Inversions of $t_{\varepsilon_1}, t_{-\varepsilon_1}$ and $t_{\varepsilon_2}$

Let  $t_\mu$  be as in (4.7) and let  $\varepsilon_i = (0, \dots, 0, 1, 0, \dots, 0)$  where the 1 appears in the  $i$ th position. Then

$$\begin{aligned} t_{\varepsilon_1} &= (1_1, 0_2, \dots, 0_n) = \begin{pmatrix} 1 & 2 & \cdots & n \\ n+1 & 2 & \cdots & n \end{pmatrix} = \pi s_{n-1} \cdots s_1, \\ t_{-\varepsilon_1} &= (-1_1, 0_2, \dots, 0_n) = \begin{pmatrix} 1 & 2 & \cdots & n \\ 1-n & 2 & \cdots & n \end{pmatrix} = s_1 \cdots s_{n-1} \pi^{-1}, \\ t_{\varepsilon_1} s_1 &= (0_2, 1_1, 0_3, \dots, 0_n) = \begin{pmatrix} 1 & 2 & 3 & \cdots & n \\ 2 & 1+n & 3 & \cdots & n \end{pmatrix} = \pi s_{n-1} \cdots s_2, \\ s_1 t_{\varepsilon_1} &= (1_2, 0_1, 0_3, \dots, 0_n) = \begin{pmatrix} 1 & 2 & 3 & \cdots & n \\ 2+n & 1 & 3 & \cdots & n \end{pmatrix} = s_1 \pi s_{n-1} \cdots s_1, \\ t_{\varepsilon_2} &= s_1 t_{\varepsilon_1} s_1 = (0_1, 1_2, 0_3, \dots, 0_n) = \begin{pmatrix} 1 & 2 & 3 & \cdots & n \\ 1 & 2+n & 3 & \cdots & n \end{pmatrix} = s_1 \pi s_{n-1} \cdots s_2, \end{aligned}$$

and

$$\begin{aligned}
 \text{Inv}(t_{\varepsilon_1}) &= \{(1, 2), (1, 3), \dots, (1, n)\} \\
 &= \{\alpha_1^\vee, s_1 \alpha_2^\vee, \dots, s_1 \cdots s_{n-2} \alpha_{n-1}^\vee\} = \{\varepsilon_1^\vee - \varepsilon_2^\vee, \varepsilon_1^\vee - \varepsilon_3^\vee, \dots, \varepsilon_1^\vee - \varepsilon_n^\vee\} \\
 \text{Inv}(t_{-\varepsilon_1}) &= \{(2-n, 1), (3-n, 1), \dots, (n-n, 1)\} = \{(n, 1+n), (n-1, 1+n), \dots, (2, 1+n)\} \\
 &= \{\pi \alpha_{n-1}^\vee, \pi s_{n-1} \alpha_{n-2}^\vee, \dots, \pi s_{n-1} \cdots s_2 \alpha_1^\vee\} \\
 &= \{\varepsilon_n^\vee - (\varepsilon_1^\vee - K), \varepsilon_{n-1}^\vee - (\varepsilon_1^\vee - K), \dots, \varepsilon_2^\vee - (\varepsilon_1^\vee - K)\} \\
 \text{Inv}(t_{\varepsilon_1} s_1) &= \{(2, 3), \dots, (2, n)\} \\
 &= \{\alpha_2^\vee, s_2 \alpha_3^\vee, \dots, s_2 \cdots s_{n-2} \alpha_{n-1}^\vee\} = \{\varepsilon_2^\vee - \varepsilon_3^\vee, \varepsilon_2^\vee - \varepsilon_4^\vee, \dots, \varepsilon_2^\vee - \varepsilon_n^\vee\} \\
 \text{Inv}(s_1 t_{\varepsilon_1}) &= \{(1, 2), (1, 3), \dots, (1, n), (1-n, 2)\} = \{(1, 2), (1, 3), \dots, (1, n), (1, 2+n)\} \\
 &= \{\alpha_1^\vee, s_1 \alpha_2^\vee, \dots, s_1 \cdots s_{n-2} \alpha_{n-1}^\vee, s_1 \cdots s_{n-2} s_{n-1} \pi^{-1} \alpha_1^\vee\} \\
 &= \{\varepsilon_1^\vee - \varepsilon_2^\vee, \varepsilon_1^\vee - \varepsilon_3^\vee, \dots, \varepsilon_1^\vee - \varepsilon_n^\vee, (\varepsilon_1^\vee + K) - \varepsilon_2^\vee\} \\
 \text{Inv}(t_{\varepsilon_2}) &= \{((2, 3), \dots, (2, n), (2-n, 1)\} = \{((2, 3), \dots, (2, n), (2, 1+n)\} \\
 &= \{\alpha_2^\vee, s_2 \alpha_3^\vee, \dots, s_2 \cdots s_{n-2} \alpha_{n-1}^\vee, s_2 \cdots s_{n-2} s_{n-1} \pi^{-1} \alpha_1^\vee\} \\
 &= \{\varepsilon_2^\vee - \varepsilon_3^\vee, \varepsilon_2^\vee - \varepsilon_4^\vee, \dots, \varepsilon_2^\vee - \varepsilon_n^\vee, (\varepsilon_2^\vee + K) - \varepsilon_1^\vee\},
 \end{aligned}$$

where we have used

$$\begin{aligned}
 s_1 \cdots s_{n-1} \pi^{-1} \alpha_1^\vee &= s_1 \cdots s_{n-1} \pi^{-1} (\varepsilon_1^\vee - \varepsilon_2^\vee) = s_1 \cdots s_{n-1} ((\varepsilon_n^\vee + K) - \varepsilon_1^\vee) = (\varepsilon_1^\vee + K) - \varepsilon_2^\vee, \quad \text{and} \\
 s_2 \cdots s_{n-1} \pi^{-1} \alpha_1^\vee &= s_2 \cdots s_{n-1} ((\varepsilon_n^\vee + K) - \varepsilon_1^\vee) = (\varepsilon_2^\vee + K) - \varepsilon_1^\vee.
 \end{aligned}$$

#### 4.0.7 The elements $u_\mu$ and $v_\mu$ for $\mu = (0, 4, 5, 1, 4)$

Let  $u_\mu, v_\mu, z_\mu$  and  $t_\mu$  be as in Section 4.0.4. If  $\mu = (0, 4, 5, 1, 4)$  then  $\lambda = (5, 4, 4, 1, 0)$ , and

$$z_\mu = s_2 s_4 s_1 s_2 s_3 s_4 \quad \text{since} \quad (5, 4, 4, 1, 0) \xrightarrow{s_1 s_2 s_3 s_4} (0, 5, 4, 4, 1) \xrightarrow{s_4} (0, 5, 4, 1, 4) \xrightarrow{s_2} (0, 4, 5, 1, 4),$$

$$\begin{aligned}
 v_\mu &= s_4 s_2 s_3 = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & 3 & 5 & 2 & 4 \end{pmatrix} \quad \text{with} \quad \begin{aligned} v_\mu(1) &= 1 = 1, \\ v_\mu(2) &= 3 = 1 + \#\{1\}, \\ v_\mu(3) &= 5 = 1 + \#\{1, 2\} + \#\{4\}, \\ v_\mu(4) &= 2 = 1 + \#\{1\}, \\ v_\mu(5) &= 4 = 1 + \#\{2, 4\}, \end{aligned} \\
 \end{aligned}$$

Then  $v_\mu = (0_1, 0_3, 0_5, 0_3, 0_4)$  and

$$\text{Inv}(v_\mu) = \{(2, 4), (3, 4), (3, 5)\} = \{\alpha_3^\vee, s_3 \alpha_2^\vee, s_3 s_2 \alpha_4^\vee\} = \{\varepsilon_3^\vee - \varepsilon_4^\vee, \varepsilon_2^\vee - \varepsilon_4^\vee, \varepsilon_3^\vee - \varepsilon_5^\vee\}.$$

Then, with  $n = 5$ ,

$$\begin{aligned}
 v_\mu^{-1} &= \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & 4 & 2 & 5 & 3 \end{pmatrix} = (0_1, 0_4, 0_2, 0_5, 0_3) \quad \text{and} \\
 u_\mu &= t_\mu v_\mu^{-1} = (0_1, 4_3, 5_5, 1_2, 4_4) = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & 4+n & 2+4n & 5+4n & 3+5n \end{pmatrix} = \begin{pmatrix} 1 & 2 & 3 & 4 & 5 \\ 1 & 5 & 10 & 25 & 28 \end{pmatrix}
 \end{aligned}$$

Then

$$\ell(t_\lambda) = \left( \begin{array}{c} (5-4) + (5-4) + (5-1) + (5-0) \\ +(4-4) + (4-1) + (4-0) \\ +(4-1) + (4-0) \\ +(1-0) \end{array} \right) = 26 = \ell(t_\mu) = \ell(u_\mu) + \ell(v_\mu)$$

with

$$\ell(u_\mu) = 6 + 7 \cdot 2 + 3 = 23, \quad \ell(v_\mu) = 3, \quad \ell(z_\mu) = 6.$$

The decreasing rearrangement of  $\mu = (0, 4, 5, 1, 4)$  is  $\lambda = (5, 4, 4, 1, 0)$  and

$$z_\lambda = 1, \quad w_\lambda = s_2, \quad v_\lambda = w_0 s_2$$

#### 4.0.8 The box greedy reduced word for $u_\mu$ .

If  $\mu = (0, 4, 5, 1, 4)$  then the box greedy reduced word for  $u_\mu$  is

$$u_\mu^\square = (s_1\pi)^6(s_2s_1\pi)^7(s_3s_2s_1\pi) = \begin{array}{c} | \\ \boxed{s_1\pi} & \boxed{s_1\pi} & \boxed{s_2s_1\pi} & \boxed{s_2s_1\pi} \\ | & | & | & | \\ \boxed{s_1\pi} & \boxed{s_1\pi} & \boxed{s_2s_1\pi} & \boxed{s_2s_1\pi} \\ | & | & | & | \\ \boxed{s_1\pi} & \boxed{s_2s_1\pi} & \boxed{s_2s_1\pi} & \boxed{s_2s_1\pi} \end{array} \quad (4.8)$$

and the length of  $u_\mu$  is

$$\ell(u_\mu) = 6 + 14 + 3 = 23, \quad \text{since } \ell(\pi) = 0 \quad \text{and} \quad \ell(s_i) = 1.$$

Using one-line notation for  $n$ -periodic permutations, the computation verifying the expression for  $u_\mu^\square$  is

$$\begin{aligned} (0_1, 4_3, 5_5, 1_2, 4_4) &\xrightarrow{s_1} (4_3, 0_1, 5_5, 1_2, 4_4) \xrightarrow{\pi^{-1}} \\ (0_1, 5_5, 1_2, 4_4, 3_3) &\xrightarrow{s_1} (5_5, 0_1, 1_2, 4_4, 3_3) \xrightarrow{\pi^{-1}} \\ (0_1, 1_2, 4_4, 3_3, 4_5) &\xrightarrow{s_1} (1_2, 0_1, 4_4, 3_3, 4_5) \xrightarrow{\pi^{-1}} \\ (0_1, 4_4, 3_3, 4_5, 0_2) &\xrightarrow{s_1} (4_4, 0_1, 3_3, 4_5, 0_2) \xrightarrow{\pi^{-1}} \\ (0_1, 3_3, 4_5, 0_2, 3_4) &\xrightarrow{s_1} (3_3, 0_1, 4_5, 0_2, 3_4) \xrightarrow{\pi^{-1}} \\ (0_1, 4_5, 0_2, 3_4, 2_3) &\xrightarrow{s_1} (4_5, 0_1, 0_2, 3_4, 2_3) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 3_4, 2_3, 3_5) &\xrightarrow{s_2} (0_1, 3_4, 0_2, 2_3, 3_5) \xrightarrow{s_1} (3_4, 0_1, 0_2, 2_3, 3_5) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 2_3, 3_5, 2_4) &\xrightarrow{s_2} (0_1, 2_3, 0_2, 3_5, 2_4) \xrightarrow{s_1} (2_3, 0_1, 0_2, 3_5, 2_4) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 3_5, 2_4, 1_3) &\xrightarrow{s_2} (0_1, 3_5, 0_2, 2_4, 1_3) \xrightarrow{s_1} (3_5, 0_1, 0_2, 2_4, 1_3) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 2_4, 1_3, 2_5) &\xrightarrow{s_2} (0_1, 2_4, 0_2, 1_3, 2_5) \xrightarrow{s_1} (2_4, 0_1, 0_2, 1_3, 2_5) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 1_3, 2_5, 1_4) &\xrightarrow{s_2} (0_1, 1_3, 0_2, 2_5, 1_4) \xrightarrow{s_1} (1_3, 0_1, 0_2, 2_5, 1_4) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 2_5, 1_4, 0_3) &\xrightarrow{s_2} (0_1, 2_5, 0_2, 1_4, 0_3) \xrightarrow{s_1} (2_5, 0_1, 0_2, 1_4, 0_3) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 1_4, 0_3, 1_5) &\xrightarrow{s_2} (0_1, 1_4, 0_2, 0_3, 1_5) \xrightarrow{s_1} (1_4, 0_1, 0_2, 0_3, 1_5) \xrightarrow{\pi^{-1}} \\ (0_1, 0_2, 0_3, 1_5, 0_4) &\xrightarrow{s_3} (0_1, 0_2, 1_5, 0_3, 0_4) \xrightarrow{s_2} (0_1, 1_5, 0_2, 0_3, 0_4) \xrightarrow{s_1} (1_5, 0_1, 0_2, 0_3, 0_4) \xrightarrow{\pi^{-1}} (0_1, 0_2, 0_3, 0_4, 0_5) \end{aligned}$$

### 4.0.9 Inversions of $u_\mu$ .

If  $\mu = (0, 4, 5, 1, 4)$  then the inversion set of  $u_\mu$  is

$\text{Inv}(u_\mu) =$	$\varepsilon_3^\vee - \varepsilon_1^\vee + 4K$	$\varepsilon_3^\vee - \varepsilon_1^\vee + 3K$	$\varepsilon_3^\vee - \varepsilon_1^\vee + 2K$ $\varepsilon_3^\vee - \varepsilon_2^\vee + 2K$	$\varepsilon_3^\vee - \varepsilon_1^\vee + K$ $\varepsilon_3^\vee - \varepsilon_2^\vee + K$	$\varepsilon_5^\vee - \varepsilon_1^\vee + 5K$
	$\varepsilon_2^\vee - \varepsilon_1^\vee + K$	$\varepsilon_5^\vee - \varepsilon_1^\vee + 4K$	$\varepsilon_5^\vee - \varepsilon_1^\vee + 3K$ $\varepsilon_5^\vee - \varepsilon_2^\vee + 3K$	$\varepsilon_5^\vee - \varepsilon_1^\vee + 2K$ $\varepsilon_5^\vee - \varepsilon_2^\vee + 2K$	
	$\varepsilon_4^\vee - \varepsilon_1^\vee + 4K$	$\varepsilon_4^\vee - \varepsilon_1^\vee + 3K$ $\varepsilon_4^\vee - \varepsilon_2^\vee + 3K$	$\varepsilon_4^\vee - \varepsilon_1^\vee + 2K$ $\varepsilon_4^\vee - \varepsilon_2^\vee + 2K$	$\varepsilon_4^\vee - \varepsilon_1^\vee + K$ $\varepsilon_4^\vee - \varepsilon_2^\vee + K$	$\varepsilon_5^\vee - \varepsilon_1^\vee + K$ $\varepsilon_5^\vee - \varepsilon_2^\vee + K$ $\varepsilon_5^\vee - \varepsilon_3^\vee + K$

The following is an example that executes the last line of the proof of [GR21, Proposition 2.2]. The factor of  $s_1$  in the factorization  $u_\mu = s_1 \pi u_{(0,5,1,4,3)}$  gives the root

$$\begin{aligned} u_{(0,5,1,4,3)}^{-1} \pi^{-1}(\varepsilon_1^\vee - \varepsilon_2^\vee) &= u_{(0,5,1,4,3)}^{-1} \pi^{-1}(\varepsilon_1^\vee - \varepsilon_2^\vee) = u_{(0,5,1,4,3)}^{-1}((\varepsilon_5^\vee + K) - \varepsilon_1^\vee) \\ &= v_{(0,5,1,4,3)} t_{(0,5,1,4,3)}^{-1}(\varepsilon_5^\vee - \varepsilon_1^\vee + K) = v_{(0,5,1,4,3)}(\varepsilon_5^\vee + 3K - (\varepsilon_1^\vee + 0K) + K) \\ &= \varepsilon_3^\vee - \varepsilon_1^\vee + 4K, \quad \text{since } v_{(0,5,1,4,3)}(5) = 3. \end{aligned}$$

#### 4.0.10 The column-greedy reduced word for $u_\mu$ .

Let  $\mu = (\mu_1, \dots, \mu_n) \in \mathbb{Z}_{\geq 0}^n$ . Let  $J = (j_1 < \dots < j_r)$  be the sequence of positions of the nonzero entries of  $\mu$  and let  $\nu$  be the composition defined by

$$\nu_j = \mu_j - 1 \quad \text{if } j \in J \quad \text{and} \quad \nu_k = 0 \quad \text{if } k \notin J,$$

so that  $\nu$  is the composition which has one fewer box than  $\mu$  in each (nonempty) row. Define the *column-greedy reduced word* for the element  $u_\mu$  inductively by setting

$$u_\mu^\downarrow = \left( \prod_{m=1}^r s_{j_m-1} \cdots s_{m+1} s_m \right) \pi^r u_\nu^\downarrow, \quad (4.9)$$

where the product is taken in increasing order.

For example, if  $\lambda = (5, 4, 4, 1, 0)$  then  $z_\lambda = 1$ ,  $w_\lambda = s_2$ ,  $v_\lambda = w_0 s_2$  and the column greedy reduced word for  $u_\lambda$  is

$u_\lambda^\downarrow = \pi^4 s_1 s_2 s_3 \pi^3 (s_2 s_1 s_3 s_2 s_4 s_3 \pi^3)^2 s_2 s_1 \pi =$	$\pi^4$	$\pi^3$	$\pi^3$	$\pi^3$	$\pi$
	$s_1$	$s_2 s_1$	$s_2 s_1$	$s_2 s_1$	$s_2 s_1$
	$s_2$	$s_3 s_2$	$s_3 s_2$	$s_3 s_2$	$s_3 s_2$
	$s_3$	$s_4 s_3$	$s_4 s_3$	$s_4 s_3$	$s_4 s_3$

The computation verifying the expression for  $u_\lambda^\downarrow$  is

$$\begin{aligned} (5, 4, 4, 1, 0) &\xrightarrow{\pi^{-4}} \\ (0, 4, 3, 3, 0) &\xrightarrow{s_1 s_2 s_3} (4, 3, 3, 0, 0) \xrightarrow{\pi^{-3}} \\ (0, 0, 3, 2, 2) &\xrightarrow{s_2 s_1 s_3 s_2 s_4 s_3} (3, 2, 2, 0, 0) \xrightarrow{\pi^{-3}} \\ (0, 0, 2, 1, 1) &\xrightarrow{s_2 s_1 s_3 s_2 s_4 s_3} (2, 1, 1, 0, 0) \xrightarrow{\pi^{-3}} \\ (0, 0, 2, 0, 0) &\xrightarrow{s_2 s_1} (1, 0, 0, 0, 0) \xrightarrow{\pi^{-1}} (0, 0, 0, 0, 0) \end{aligned}$$

If  $\mu = (0, 4, 5, 1, 4)$  then the column greedy reduced word for  $u_\mu$  is

$$u_\mu^\downarrow = s_1 s_2 s_3 s_4 \pi^4 \cdot s_1 s_2 s_4 s_3 \pi^3 \cdot s_2 s_1 s_3 s_2 s_4 s_3 \pi^3 \cdot s_2 s_1 s_3 s_2 s_4 s_3 \pi^3 \cdot s_3 s_2 s_1 \pi.$$

This follows from (4.8) by using that  $\pi s_i \pi^{-1} = s_{i+1}$ .

## 5 The step-by-step and box-by-box recursions

### 5.0.1 Examples of the step-by-step recursion

Examples illustrating [GR21, Proposition 4.1(a)] are

$$E_{(1,0,0,1,0,0)}^{(56234)} = x_1 E_{(0,0,1,0,0,0)}^{(562341)}, \quad E_{(1,0,0,1,0,0)}^{(516234)} = x_5 E_{(0,0,1,0,0,0)}^{(162345)}, \quad E_{(1,0,0,1,0,0)}^{(651234)} = x_6 E_{(0,0,1,0,0,0)}^{(512346)}.$$

An example illustrating [GR21, Proposition 4.1(b)] with  $zs_i < z$  is

$$\begin{aligned} E_{(0,0,1,1,0,0)}^{(561234)} &= E_{(0,1,0,1,0,0)}^{(516234)} + \left( \frac{1-t}{1-qt^{5-2}} \right) qt^{5-2} t^{-3} E_{(0,1,0,1,0,0)}^{(561234)} \\ &= E_{(0,1,0,1,0,0)}^{(516234)} + \left( \frac{1-t}{1-qt^{5-2}} \right) q E_{(0,1,0,1,0,0)}^{(561234)}, \end{aligned}$$

with  $\mu = (0, 0, 1, 1, 0, 0)$  and  $z = (561234)$ ,

$$zv_\mu^{-1} = (563412), \quad v_\mu^{-1} = (125634), \quad zv_{s_2\mu}^{-1} = (513462), \quad v_{s_2\mu}^{-1} = (135624),$$

and

$$-\frac{1}{2}(\ell(zv_\mu^{-1}) - \ell(v_\mu^{-1}) - \ell(zv_{s_2\mu}^{-1}) + \ell(v_{s_2\mu}^{-1})) = -\frac{1}{2}(12 - 4 - 7 + 5) = -\frac{1}{2} \cdot 6 = -3.$$

An example illustrating [GR21, Proposition 4.1(b)] with  $zs_i > z$  is

$$E_{(0,1,0,1,0,0)}^{(561234)} = E_{(1,0,0,1,0,0)}^{(651234)} + \left( \frac{1-t}{1-qt^{5-1}} \right) E_{(1,0,0,1,0,0)}^{(561234)}$$

with  $\mu = (0, 1, 0, 1, 0, 0)$  and  $z = (561234)$ ,

$$zv_\mu^{-1} = (513462), \quad v_\mu^{-1} = (135624), \quad zv_{s_1\mu}^{-1} = (613452), \quad v_{s_1\mu}^{-1} = (235614),$$

and

$$-\frac{1}{2}(\ell(zv_\mu^{-1}) - \ell(v_\mu^{-1}) - \ell(zv_{s_1\mu}^{-1}) + \ell(v_{s_1\mu}^{-1})) = -\frac{1}{2}(7 - 5 - 8 + 6) = 0.$$

### 5.0.2 Examples of the box by box recursion

An example executing the box-by-box recursion is provided just after Theorem 1.1. in [GR21].

### 5.0.3 An example of a $2^{j-1}$ to $j$ term compression when $j = 3$

In order to check the powers of  $t$  in [GR21, Lemma 4.2] compute  $\tau_2^\vee \tau_1^\vee E_\gamma$ ,

$$\begin{aligned}\tau_2^\vee \tau_1^\vee E_\gamma &= C_{-\beta_2^\vee} (T_1 + f_{-\beta_1^\vee}) E_\gamma = C_{-\beta_2^\vee} T_1 E_\gamma + f_{-\beta_1^\vee} C_{-\beta_2^\vee} E_\gamma \\ &= C_{-\beta_2^\vee} T_1 E_\gamma + c_{-\beta_2^\vee} f_{-\beta_1^\vee} E_\gamma = (T_2 + f_{-\beta_2^\vee}) T_1 E_\gamma + c_{-\beta_2^\vee} f_{-\beta_1^\vee} E_\gamma \\ &= T_2 T_1 E_\gamma + f_{-\beta_2^\vee} T_1 E_\gamma + t^{-\frac{1}{2}} f_{-\beta_2^\vee} E_\gamma \\ &= T_2 T_1 E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} (t^{-\frac{1}{2}} T_1 E_\gamma + t^{-\frac{2}{2}} E_\gamma).\end{aligned}$$

Now replace  $T_2 = T_2^{-1} + (t^{\frac{1}{2}} - t^{-\frac{1}{2}})$  to get

$$\begin{aligned}\tau_2^\vee \tau_1^\vee E_\gamma &= (T_2^{-1} + (t^{\frac{1}{2}} - t^{-\frac{1}{2}})) T_1 E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} (t^{-\frac{1}{2}} T_1 E_\gamma + t^{-\frac{2}{2}} E_\gamma) \\ &= T_2^{-1} T_1 E_\gamma + (t - 1 + t^{\frac{1}{2}} f_{-\beta_2^\vee}) t^{-\frac{1}{2}} T_1 E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} t^{-\frac{2}{2}} E_\gamma \\ &= T_2^{-1} T_1 E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} d_{-\beta_2^\vee} t^{-\frac{1}{2}} T_1 E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} t^{-\frac{2}{2}} E_\gamma,\end{aligned}$$

and then replacing  $T_1$  in the first term by  $T_1 = T_1^{-1} + (t^{\frac{1}{2}} - t^{-\frac{1}{2}})$

$$\begin{aligned}\tau_2^\vee \tau_1^\vee E_\gamma &= T_2^{-1} (T_1^{-1} + t^{-\frac{1}{2}}(t-1)) E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} d_{-\beta_2^\vee} t^{-\frac{1}{2}} T_1 E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} t^{-\frac{2}{2}} E_\gamma \\ &= T_2^{-1} T_1^{-1} E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} d_{-\beta_2^\vee} t^{-\frac{1}{2}} T_1 E_\gamma + t^{-\frac{1}{2}}(1-t) t^{-\frac{1}{2}} E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} t^{-\frac{2}{2}} E_\gamma \\ &= T_2^{-1} T_1^{-1} E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} d_{-\beta_2^\vee} t^{-\frac{1}{2}} T_1 E_\gamma + (t - 1 + t^{\frac{1}{2}} f_{-\beta_2^\vee}) t^{-\frac{2}{2}} E_\gamma \\ &= T_2^{-1} T_1^{-1} E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} d_{-\beta_2^\vee} t^{-\frac{1}{2}} T_1 E_\gamma + t^{\frac{1}{2}} f_{-\beta_2^\vee} d_{-\beta_2^\vee} t^{-\frac{2}{2}} E_\gamma.\end{aligned}$$

### 5.0.4 Check of the norm statistic in the step by step recursion

This is an example which is helpful for checking the coefficients in [GR21, Proposition 4.3] and its proof. Let

$$\mu = (0, 0, 1, 1, 0, 0), \quad \gamma = (1, 0, 0, 1, 0, 0), \quad \nu = (0, 0, 1, 0, 0, 0) \quad \text{and} \quad z = y = (561234).$$

Then

$$\begin{aligned}v_\mu^{-1} &= (125634), & \ell(v_\mu^{-1}) &= 2 + 2 = 4, \\ yv_\mu^{-1} &= (563412), & \ell(yv_\mu^{-1}) &= 4 + 4 + 2 + 2 = 12, \\ v_\gamma^{-1} &= (235614), & \ell(v_\gamma^{-1}) &= 1 + 1 + 2 + 2 = 6, \\ ys_2 s_1 v_\gamma^{-1} &= (563412), & \ell(ys_2 s_1 v_\gamma^{-1}) &= 4 + 4 + 2 + 2 = 12, \\ ys_1 v_\gamma^{-1} &= (513462), & \ell(ys_1 v_\gamma^{-1}) &= 4 + 1 + 1 + 1 = 7, \\ yv_\gamma^{-1} &= (613452) & \ell(yv_\gamma^{-1}) &= 5 + 1 + 1 + 1 = 8.\end{aligned}$$

Then  $j = 3$  and

$$\begin{aligned}E_\mu^y &= t^{-\frac{1}{2}(\ell(yv_\mu) - \ell(v_\mu^{-1}) - (3-1)} T_y \tau_2^\vee \tau_1^\vee E_\gamma = t^{-\frac{1}{2}(12-4-2)} T_y \tau_2^\vee \tau_1^\vee E_\gamma, \\ E_\gamma^{ys_2 s_1} &= t^{-\frac{1}{2}(\ell(ys_2 s_1 v_\gamma^{-1}) - \ell(v_\gamma^{-1})} T_{ys_2 s_1} E_\gamma = t^{-\frac{1}{2}(12-6)} T_{ys_2 s_1} E_\gamma = t^{-\frac{6}{2}} T_y T_2^{-1} T_1^{-1} E_\gamma \\ E_\gamma^{ys_1} &= t^{-\frac{1}{2}(\ell(ys_1 v_\gamma^{-1}) - \ell(v_\gamma^{-1})} T_{ys_1} E_\gamma = t^{-\frac{1}{2}(7-6)} T_{ys_1} E_\gamma = t^{-\frac{1}{2}} T_y T_1 E_\gamma \\ E_\gamma^y &= t^{-\frac{1}{2}(\ell(yv_\gamma^{-1}) - \ell(v_\gamma^{-1})} T_y E_\gamma = t^{-\frac{1}{2}(8-6)} T_y E_\gamma = t^{-\frac{2}{2}} T_y E_\gamma\end{aligned}$$

so that

$$\begin{aligned} t^{\frac{6}{2}} E_\mu^y &= t^{\frac{6}{2}} E_\gamma^{ys_2s_1} + d_{-\beta_1^\vee} f_{-\beta_1^\vee} t^{\frac{1}{2}} E_\gamma^{ys_1} + t^{-\frac{1}{2}} d_{-\beta_1^\vee} f_{-\beta_1^\vee} t^{\frac{2}{2}} E_\gamma^y \\ &= t^{\frac{6}{2}} E_\gamma^{ys_2s_1} + \frac{1-t}{1-qt^{5-2}} qt^{5-2} E_\gamma^{ys_1} + \frac{1-t}{1-qt^{5-2}} qt^{5-2} E_\gamma^y \end{aligned}$$

giving

$$E_\mu^y = E_\gamma^{ys_2s_1} + \frac{1-t}{1-qt^{5-2}} q E_\gamma^{ys_1} + \frac{1-t}{1-qt^{5-2}} q E_\gamma^y$$

as in the second line of the example in 5.0.2.

### 5.0.5 Check of the statistic for $E_{\varepsilon_j}^z$ where $z(j) = j+k$

This is an example of [GR21, Proposition 4.3] with

$$\mu = \varepsilon_j, \quad \gamma = \varepsilon_1, \quad y = s_{j+(k-1)} \cdots s_j.$$

Then

$$v_\mu = s_{n-1} \cdots s_j, \quad v_\gamma = s_{n-1} \cdots s_1, \quad v_\mu^{-1} = s_j \cdots s_{n-1}, \quad v_\gamma^{-1} = s_1 \cdots s_{n-1}.$$

Then  $yv_\mu^{-1} = s_{j+k} \cdots s_{n-1}$  and  $\ell(yv_\mu^{-1}) = (n-1) - (j-1) - k$  and

$$\ell(yv_\mu^{-1}) - \ell(v_\mu^{-1}) - (j-1) = ((n-1) - (j-1) - k) - ((n-1) - (j-1)) = -k - (j-1).$$

Then  $yc_a^{-1}c_jv_\mu^{-1} = ((s_{j+(k-1)} \cdots s_j)(s_a \cdots s_{j-1})(s_j \cdots s_{n-1}))$  and

$$\ell(yc_a^{-1}c_jv_\mu^{-1}) = (j-1+k-(j-1)) + ((j-1)-(a-1)) + (n-1-(j-1)) = (n-1)-(a-1)+k.$$

So

$$\begin{aligned} \ell(yc_a^{-1}c_jv_\mu^{-1}) - \ell(yv_\mu^{-1}) - \ell(c_a^{-1}c_j) &= (n-1)-(a-1)+k - ((n-1)-(j-1)-k) - ((j-1)-(a-1)) \\ &= 2k. \end{aligned}$$

Thus

$$\begin{aligned} E_\mu^z &= E_\mu^y = x_{y(j)} E_\nu^{yc_n} + \frac{(1-t)}{1-q^{\mu_j} t^{v_\mu(j)-(j-1)}} \sum_{a=0}^{j-1} t^{\frac{1}{2} \cdot 2k} x_{y(a)} E_\nu^{yc_a^{-1}c_n} \\ &= x_{y(j)} + \frac{(1-t)}{1-q^{\mu_j} t^{v_\mu(j)-(j-1)}} \sum_{a=0}^{j-1} t^k x_{y(a)}. \end{aligned}$$

## 6 Type $GL_n$ DAArt, DAHA and the polynomial representation

### 6.0.1 Example to check the eigenvalues of $Y_i$ on $E_\mu$

The box greedy reduced words for  $u_{(2,1,0)}$ ,  $u_{(2,0,1)}$  and  $u_{(1,2,0)}$  are

$$u_{(2,1,0)}^\square = \begin{vmatrix} \boxed{\pi} & \boxed{s_1\pi} \\ \boxed{\pi} & \end{vmatrix} \quad u_{(2,0,1)}^\square = \begin{vmatrix} \boxed{\pi} & \boxed{s_1\pi} \\ & \boxed{s_1\pi} \end{vmatrix} \quad u_{(1,2,0)}^\square = \begin{vmatrix} \boxed{\pi} \\ \boxed{\pi} & \boxed{s_2s_1\pi} \end{vmatrix}$$

Using  $u_\mu = t_\mu v_\mu^{-1}$  to carefully compute  $v_\mu^{-1}$ :

$$\begin{aligned} u_{(2,1,0)} &= \pi^2 s_1 \pi = t_{\varepsilon_1} s_1 s_2 t_{\varepsilon_1} s_1 s_2 s_1 t_{\varepsilon_1} s_1 s_2 \\ &= t_{\varepsilon_1} t_{\varepsilon_2} s_1 s_2 s_1 s_2 s_1 t_{\varepsilon_1} s_1 s_2 \\ &= t_{\varepsilon_1} t_{\varepsilon_2} s_2 t_{\varepsilon_1} s_1 s_2 \\ &= t_{2\varepsilon_1+\varepsilon_2} s_2 s_1 s_2, \quad \text{so} \quad v_{(2,1,0)}^{-1} = s_2 s_1 s_2. \end{aligned}$$

$$\begin{aligned} u_{(2,0,1)} &= \pi s_1 \pi s_1 \pi = t_{\varepsilon_1} s_1 s_2 s_1 t_{\varepsilon_1} s_1 s_2 s_1 t_{\varepsilon_1} s_1 s_2 \\ &= t_{\varepsilon_1} t_{\varepsilon_3} s_1 s_2 s_1 s_1 s_2 s_1 t_{\varepsilon_1} s_1 s_2 \\ &= t_{2\varepsilon_1+\varepsilon_3} s_1 s_2, \quad \text{so} \quad v_{(2,0,1)}^{-1} = s_1 s_2. \end{aligned}$$

$$\begin{aligned} u_{(1,2,0)} &= \pi^2 s_2 s_1 \pi = t_{\varepsilon_1} s_1 s_2 t_{\varepsilon_1} s_1 s_2 s_2 s_1 t_{\varepsilon_1} s_1 s_2 \\ &= t_{\varepsilon_1+2\varepsilon_2} s_1 s_2 s_1 s_2 \\ &= t_{\varepsilon_1+2\varepsilon_2} s_2 s_1, \quad \text{so} \quad v_{(1,2,0)}^{-1} = s_2 s_1. \end{aligned}$$

Using

$$\begin{aligned} u_{(2,1,0)} &= t_{(2,1,0)} s_1 s_2 s_1 = t_{(2,1,0)} v_{(2,1,0)}^{-1}, & u_{(2,0,1)} &= t_{(2,0,1)} s_1 s_2 = t_{(2,0,1)} v_{(2,0,1)}^{-1}, \\ u_{(1,2,0)} &= t_{(1,2,0)} s_2 s_1 = t_{(1,2,0)} v_{(1,2,0)}^{-1}, & u_{(0,2,1)} &= t_{(0,2,1)} s_2 = t_{(0,2,1)} v_{(0,2,1)}^{-1}, \\ u_{(1,0,2)} &= t_{(1,0,2)} s_2, = t_{(1,0,2)} v_{(1,0,2)}^{-1}, & u_{(0,1,2)} &= t_{(0,1,2)} = t_{(0,1,2)} v_{(0,1,2)}^{-1}, \end{aligned}$$

and the relations

$$Y_1 \tau_\pi^\vee = q^{-1} \tau_\pi^\vee Y_3, \quad Y_2 \tau_\pi^\vee = \tau_\pi^\vee Y_1, \quad Y_3 \tau_\pi^\vee = \tau_\pi^\vee Y_2,$$

then

$$\begin{aligned} Y_1 E_{(2,1,0)} &= t^{-\frac{3}{2}} Y_1 \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee Y_3 \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee Y_2 \tau_1^\vee \tau_\pi^\vee \mathbf{1} \\ &= t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee Y_1 \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} q^{-2} \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee Y_3 \mathbf{1} = q^{-2} t^{-(3-1)+\frac{1}{2}(3-1)} E_{(2,1,0)}, \\ Y_2 E_{(2,1,0)} &= t^{-\frac{3}{2}} Y_2 \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} \tau_\pi^\vee Y_1 \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee Y_3 \tau_1^\vee \tau_\pi^\vee \mathbf{1} \\ &= t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee Y_3 \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee Y_2 \mathbf{1} = q^{-1} t^{-(2-1)+\frac{1}{2}(3-1)} E_{(2,1,0)}, \\ Y_3 E_{(2,1,0)} &= t^{-\frac{3}{2}} Y_3 \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} \tau_\pi^\vee Y_2 \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee Y_1 \tau_1^\vee \tau_\pi^\vee \mathbf{1} \\ &= t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee Y_2 \tau_\pi^\vee \mathbf{1} = t^{-\frac{3}{2}} q^{-1} \tau_\pi^\vee \tau_\pi^\vee \tau_1^\vee \tau_\pi^\vee Y_1 \mathbf{1} = t^{-(1-1)+\frac{1}{2}(3-1)} E_{(2,1,0)}. \end{aligned}$$

Then

$$\begin{aligned} Y_1 E_{(1,2,0)} &= t^{\frac{1}{2}} Y_1 \tau_1^\vee E_{(2,1,0)} = t^{\frac{1}{2}} \tau_1^\vee Y_2 E_{(2,1,0)} = q^{-1} t^{-(2-1)+\frac{1}{2}(3-1)} E_{(1,2,0)}, \\ Y_2 E_{(1,2,0)} &= t^{\frac{1}{2}} Y_2 \tau_1^\vee E_{(2,1,0)} = t^{\frac{1}{2}} \tau_1^\vee Y_1 E_{(2,1,0)} = q^{-2} t^{-(3-1)+\frac{1}{2}(3-1)} E_{(1,2,0)}, \\ Y_3 E_{(1,2,0)} &= t^{\frac{1}{2}} Y_3 \tau_1^\vee E_{(2,1,0)} = t^{\frac{1}{2}} \tau_1^\vee Y_3 E_{(2,1,0)} = q^{-0} t^{-(1-1)+\frac{1}{2}(3-1)} E_{(1,2,0)}, \end{aligned}$$

and  $v_{(1,2,0)}(1) = s_1 s_2(1) = s_1(1) = 2$ ,  $v_{(1,2,0)}(2) = s_1 s_2(2) = s_1(3) = 3$  and  $v_{(1,2,0)}(3) = s_1 s_2(3) = s_1(2) = 1$ .

### 6.0.2 The elements $X^{\omega_r}$ .

For  $i \in \{1, \dots, n\}$  let  $\omega_i = \varepsilon_1 + \dots + \varepsilon_i$ . Then

$$X^{\omega_i} = X^{\varepsilon_1 + \dots + \varepsilon_i} = (g^\vee)^i T_{w_i}^{-1}, \quad \text{where } w_i = \begin{pmatrix} 1 & \cdots & i & i+1 & \cdots & n \\ i+1 & \cdots & n & 1 & \cdots & i \end{pmatrix}$$

In  $W$ , the element  $t_{\omega_i} = \pi^i w_i$ . There are two favorite choices of reduced word for  $w_i$ , which are

$$w_i = (s_i \cdots s_{n-1})(s_{i-1} \cdots s_{n-2}) \cdots (s_1 \cdots s_{n-i}) = (s_i \cdots s_1)(s_{i+1} \cdots s_2) \cdots (s_{n-1} \cdots s_{n-i})$$

For example, if  $n = 6$  then

$$\begin{aligned} w_1 &= s_5 s_4 s_3 s_2 s_1, \\ w_2 &= (s_4 s_3 s_2 s_1)(s_5 s_4 s_3 s_2) = (s_4 s_5)(s_3 s_4)(s_2 s_3)(s_1 s_2) \\ w_3 &= (s_3 s_2 s_1)(s_4 s_3 s_2)(s_5 s_4 s_3) = (s_3 s_4 s_5)(s_2 s_3 s_4)(s_1 s_2 s_3) \\ w_4 &= (s_2 s_1)(s_3 s_2)(s_4 s_3)(s_5 s_4) = (s_2 s_3 s_4 s_5)(s_1 s_2 s_3 s_4) \\ w_5 &= s_1 s_2 s_3 s_4 s_5 \\ w_6 &= 1, \end{aligned}$$

and

$$\begin{aligned} X^{\omega_1} &= g^\vee T_5^{-1} T_4^{-1} T_3^{-1} T_2^{-1} T_1^{-1}, \\ X^{\omega_2} &= (g^\vee)^2 (T_4^{-1} T_3^{-1} T_2^{-1} T_1^{-1}) (T_5^{-1} T_4^{-1} T_3^{-1} T_2^{-1}) \\ &\quad = (g^\vee)^2 (T_4^{-1} T_5^{-1}) (T_3^{-1} T_4^{-1}) (T_2^{-1} T_3^{-1}) (T_1^{-1} T_2^{-1}) \\ X^{\omega_3} &= (g^\vee)^3 (T_3^{-1} T_2^{-1} T_1^{-1}) (T_4^{-1} T_3^{-1} T_2^{-1}) (T_5^{-1} T_4^{-1} T_3^{-1}) \\ &\quad = (g^\vee)^3 (T_3^{-1} T_4^{-1} T_5^{-1}) (T_2^{-1} T_3^{-1} T_4^{-1}) (T_1^{-1} T_2^{-1} T_3^{-1}) \\ X^{\omega_4} &= (g^\vee)^4 (T_2^{-1} T_1^{-1}) (T_3^{-1} T_2^{-1}) (T_4^{-1} T_3^{-1}) (T_5^{-1} T_4^{-1}) \\ &\quad = (g^\vee)^4 (T_2^{-1} T_3^{-1} T_4^{-1} T_5^{-1}) (T_1^{-1} T_2^{-1} T_3^{-1} T_4^{-1}) \\ X^{\omega_5} &= (g^\vee)^5 T_1^{-1} T_2^{-1} T_3^{-1} T_4^{-1} T_5^{-1} \\ X^{\omega_6} &= (g^\vee)^6. \end{aligned}$$

### 6.0.3 Type $GL_2$

For type  $GL_2$ ,  $X_1 = g^\vee T_1^{-1}$  and  $X_2 = T_1 X_1 T_1 = T_1 g^\vee$  and

$$X_1 X_2 = (g^\vee)^2, \quad X_1^{k+1} T_1 = (g^\vee T_1^{-1})^k g^\vee, \quad (T_1 g^\vee)^k = X_2^k.$$

The box greedy reduced words for the first few cases are

$$\begin{aligned} u_{(1,0)}^\square &= \left| \boxed{\pi} \right| & u_{(0,1)}^\square &= \left| \boxed{s_1 \pi} \right| \\ u_{(2,0)}^\square &= \left| \boxed{\pi} \quad \boxed{s_1 \pi} \right| & u_{(1,1)}^\square &= \left| \boxed{\pi} \quad \boxed{\pi} \right| & u_{(0,2)}^\square &= \left| \boxed{s_1 \pi} \quad \boxed{s_1 \pi} \right| \\ u_{(3,0)}^\square &= \left| \boxed{\pi} \quad \boxed{s_1 \pi} \quad \boxed{s_1 \pi} \right| \end{aligned}$$

In this case the construction of  $E_\mu$  as  $E_\mu = t^{\frac{1}{2}\ell(v_\mu^{-1})} \tau_{u_\mu}^\vee \mathbf{1}$  in [GR21, Proposition 5.7] is

$$E_{(k+h,k)} = t^{-\frac{1}{2}} (\tau_\pi^\vee)^{2k} (\tau_\pi^\vee \tau_1^\vee)^{h-1} \tau_\pi^\vee \mathbf{1} \quad \text{and} \quad E_{(k,k+h)} = (\tau_\pi^\vee)^{2k} (\tau_1^\vee \tau_\pi^\vee)^h \mathbf{1}, \quad \text{with } \tau_\pi^\vee = g^\vee.$$

Let  $h \in \mathbb{Z}_{>0}$ . The nonattacking fillings and words for  $E_{(h,0)}$  and  $E_{(0,h)}$  are

$$\begin{array}{c|ccccc} 1 & 1 & i_1 & \cdots & i_{h-1} & i_h \\ \hline 2 & & & & & \end{array} \quad \text{and} \quad \begin{array}{c|ccccc} 1 & & & & & \\ \hline 2 & i_1 & \cdots & i_{h-1} & i_h & \end{array} \quad \text{with } i_1, \dots, i_h \in \{1, 2\}.$$

$$x_1 x_{i_2} \cdots x_{i_h} \qquad \qquad x_{i_1} \cdots x_{i_h}$$

## 7 Additional examples

### 7.0.1 Formulas for $E_\mu$ when $n = 2$ .

$$E_{(0,0)} = 1,$$

$$E_{(1,0)} = x_1,$$

$$E_{(0,1)} = x_2 + \left( \frac{1-t}{1-qt} \right) x_1,$$

$$E_{(1,1)} = x_1 x_2,$$

$$E_{(2,0)} = x_1^2 + \left( \frac{1-t}{1-qt} \right) q x_1 x_2,$$

$$E_{(0,2)} = x_2^2 + \left( \frac{1-t}{1-q^2t} \right) x_1^2 + \left( \left( \frac{1-t}{1-qt} \right) + \left( \frac{1-t}{1-q^2t} \right) \left( \frac{1-t}{1-qt} \right) q \right) x_1 x_2,$$

$$E_{(3,0)} = x_1^3 + \left( \frac{1-t}{1-q^2t} \right) q^2 x_1 x_2^2 + \left( \left( \frac{1-t}{1-qt} \right) q + \left( \frac{1-t}{1-q^2t} \right) \left( \frac{1-t}{1-qt} \right) q^2 \right) x_1^2 x_2.$$

Then [Mac03, (6.2.7) and (6.28)] provides the general formula as follows. Let

$$(x; q)_\infty = (1-x)(1-xq)(1-xq^2) \cdots, \quad (x; q)_r = \frac{(x; q)_\infty}{(q^r x; q)_\infty}, \quad \text{and} \quad \begin{bmatrix} s \\ r \end{bmatrix} = \frac{(q; q)_s}{(q; q)_r (q; q)_{s-r}}.$$

Let  $k \in \mathbb{Z}_{>0}$  and let  $t = q^k$ . Then

$$\begin{aligned} E_{(0,m)} &= \begin{bmatrix} k+m \\ m \end{bmatrix}^{-1} \sum_{i+j=m} \begin{bmatrix} k+i-1 \\ i \end{bmatrix} \begin{bmatrix} k+j \\ j \end{bmatrix} x_1^j x_2^i \\ E_{(m+1,0)} &= \begin{bmatrix} k+m \\ m \end{bmatrix}^{-1} \sum_{i+j=m} \begin{bmatrix} k+i-1 \\ i \end{bmatrix} \begin{bmatrix} k+j \\ j \end{bmatrix} q^i x_1^{j+1} x_2^i \end{aligned}$$

Since  $t = q^k$ , it appears that  $t$  must be a power of  $q$ . But this is not really the case since we may rewrite these formulas using

$$\begin{bmatrix} k+m \\ m \end{bmatrix} = \frac{(q; q)_{k+m}}{(q; q)_m (q; q)_k} = \frac{(q; q)_\infty (q^m; q)_\infty (q^k; q)_\infty}{(q^{k+m}; q)_\infty (q; q)_\infty (q; q)_\infty} = \frac{(q^m; q)_\infty (t; q)_\infty}{(tq^m; q)_\infty (q; q)_\infty} = \frac{(t; q)_m}{(q; q)_m}$$

and

$$\begin{bmatrix} k+i-1 \\ i \end{bmatrix} \begin{bmatrix} k+j \\ j \end{bmatrix} = \frac{(q^i; q)_\infty (tq^{-1}; q)_\infty}{(tq^{i-1}; q)_\infty (q; q)_\infty} \frac{(q^j; q)_\infty (t; q)_\infty}{(tq^j; q)_\infty (q; q)_\infty} = \frac{(q^i; q)_\infty (q^j; q)_\infty (tq^{-1}; q)_\infty (t; q)_\infty}{(q; q)_\infty (q; q)_\infty (tq^{i-1}; q)_\infty (tq^j; q)_\infty}$$

### 7.0.2 Some small $E_\mu$ for $n = 3$ .

$$\begin{aligned}
 E_{(0,0,0)} &= 1, \\
 E_{(1,0,0)} &= x_1, \\
 E_{(0,1,0)} &= x_2 + \left(\frac{1-t}{1-qt^2}\right)x_1, \\
 E_{(0,0,1)} &= x_3 + \left(\frac{1-t}{1-qt}\right)(x_2 + x_1) \\
 E_{(1,1,0)} &= x_1x_2, \\
 E_{(1,0,1)} &= x_1x_3 + \left(\frac{1-t}{1-qt^2}\right)x_1x_2, \\
 E_{(0,1,1)} &= x_2x_3 + \left(\frac{1-t}{1-qt}\right)(x_1x_3 + x_1x_2), \\
 E_{(2,0,0)} &= x_1^2 + \left(\frac{1-t}{1-qt}\right)q(x_1x_3 + x_1x_2), \\
 E_{(2,2,0)} &= x_1^2x_2^2 + \left(\frac{1-t}{1-qt^2}\right)qx_1^2x_2x_3 + \left(\frac{1-t}{1-qt^2}\right)qx_1x_2^2x_3,
 \end{aligned}$$

and  $E_{(2,1,0)}$ ,  $E_{(2,0,1)}$ ,  $E_{(1,2,0)}$ ,  $E_{(0,2,1)}$ ,  $E_{(1,0,2)}$ ,  $E_{(0,1,2)}$  are given in section 1.3.1. Additionally,

$$\begin{aligned}
 P_{(1,0,0)} &= m_1 = x_1 + x_2 + x_3, \\
 P_{(2,0,0)} &= m_{1^2} + \frac{(1-q^2)(1-t)}{(1-q)(1-tq)}m_2, \\
 P_{(1,1,0)} &= m_{1^2} = x_1x_2 + x_1x_3 + x_2x_3,
 \end{aligned}$$

where  $m_\lambda = \sum_{\mu \in S_n \lambda} x^\mu$  is the monomial symmetric function so that  $m_2 = x_1^2 + x_2^2 + x_3^2$ .

### 7.0.3 $E_\lambda$ and $P_\lambda$ when $\lambda$ is a partition with 3 boxes.

Letting  $x^g amma = x_1^{\gamma_1} \cdots x_n^{\gamma_n}$  if  $\gamma = (\gamma_1, \dots, \gamma_n)$ , let

$$m_\lambda = \sum_{\gamma \in S_n \lambda} x^\gamma, \quad \text{be the monomial symmetric function (orbit sum).}$$

**Proposition 7.1.** Let  $\varepsilon_i = (0, \dots, 0, 1, 0, \dots, 0)$  where the 1 appears in the  $i$ th spot. Then

$$\begin{aligned}
 E_{3\varepsilon_1} &= x_1^3 + \left(\frac{1-t}{1-q^2t}\right)q^2 \sum_{k \in \{2, \dots, n\}} x_1x_k^2 + \left(\frac{1-t}{1-qt}\right)\left(1 + \left(\frac{1-t}{1-q^2t}\right)q\right)q \sum_{k \in \{2, \dots, n\}} x_1^2x_k \\
 &\quad + \left(\frac{1-t}{1-qt}\right)\left(\frac{1-t}{1-q^2t}\right)(1+q)q^2 \sum_{\{k, \ell\} \subseteq \{2, \dots, n\}} x_1x_kx_\ell, \\
 E_{2\varepsilon_1+\varepsilon_2} &= x_1^2x_n + \left(\frac{1-t}{1-qt^2}\right)q(x_1x_2x_n + \cdots + x_1x_2x_4 + x_1x_2x_3), \\
 E_{\varepsilon_1+\varepsilon_2+\varepsilon_3} &= x_1x_2x_3, \\
 P_{3\varepsilon_1} &= m_3 + \frac{(1-q^3)}{(1-tq^2)}\left(\frac{1-t}{1-q}\right)m_{21} + \frac{(1-q^3)}{(1-tq^2)}\frac{(1-q^2)}{(1-tq)}\left(\frac{1-t}{1-q}\right)^2 m_{1^3}, \\
 P_{2\varepsilon_1+\varepsilon_2} &= m_{21} + \left(\frac{(1-t^2)}{(1-qt)}\frac{(1-q^2t)}{(1-qt^2)} + \frac{(1-t)}{(1-q)}\frac{(1-q^2)}{(1-qt)}\right)m_{1^3}, \\
 P_{\varepsilon_1+\varepsilon_2+\varepsilon_3} &= m_{1^3} = e_3, \quad \text{where } e_r \text{ denotes the elementary symmetric function.}
 \end{aligned}$$

*Proof.* From [GR21, Proposition 3.5(b)],

$$\begin{aligned} E_{2\varepsilon_n} &= x_n^2 + \left(\frac{1-t}{1-q^2t}\right) \sum_{k \in \{1, \dots, n-1\}} x_k^2 + \left(\frac{1-t}{1-qt}\right) \left(1 + \left(\frac{1-t}{1-q^2t}\right)q\right) \sum_{k \in \{1, \dots, n-1\}} x_k x_n \\ &\quad + \left(\frac{1-t}{1-qt}\right) \left(\frac{1-t}{1-q^2t}\right) (1+q) \sum_{\{k, \ell\} \subseteq \{1, \dots, n-1\}} x_k x_\ell, \end{aligned}$$

and applying [GR21, Proposition 5.8(c)] gives the formula for  $E_{3\varepsilon_1} = E_{\pi 2\varepsilon_n}$ . Similarly, from [GR21, Proposition 3.5(c)],

$$E_{\varepsilon_1 + \varepsilon_n} = x_1 x_n + \left(\frac{1-t}{1-qt^2}\right) (x_1 x_{n-1} + \dots + x_1 x_3 + x_1 x_2),$$

and applying [GR21, Proposition 5.8(c)] gives the formula for  $E_{2\varepsilon_1 + \varepsilon_2} = E_{\pi(\varepsilon_1 + \varepsilon_n)}$  in the statement. The formula for  $E_{\varepsilon_1 + \varepsilon_2 + \varepsilon_3}$  follows from the first statement of Proposition 7.2.

For  $r \in \mathbb{Z}_{\geq 0}$  and  $\mu \in \mathbb{Z}_{\geq 0}^n$  define

$$(x; q)_r = (1-x)(1-xq)(1-xq^2)\cdots(1-xq^{r-1}) \quad \text{and} \quad (x; q)_\mu = (x; q)_{\mu_1} \cdots (x; q)_{\mu_n}$$

(when  $r = 0$  then  $(x; q)_0 = 1$ ). As proved in [Mac, Ch. VI equation (4.9) and Ch. VI §2 Ex. 1], if  $r \in \mathbb{Z}_{>0}$  then

$$P_{\varepsilon_1 + \dots + \varepsilon_r} = e_r = m_{1^r} \quad \text{and} \quad P_{r\varepsilon_1} = \sum_{|\mu|=r} \frac{(q; q)_r}{(t; q)_r} \frac{(t; q)_\mu}{(q; q)_\mu} m_\mu.$$

By [Mac, Ch. VI (4.3) and (4.10)], the formula for  $P_{2\varepsilon_1 + \varepsilon_2}$  follows from the formula for  $P_{(2,1,0)}$  in 3 variables given at the end of section 1.3.1.  $\square$

#### 7.0.4 Macdonald polynomials $E_\mu^z$ and $P_\mu$ when $\mu$ is a single column.

**Proposition 7.2.** Let  $r \in \{1, \dots, n\}$  and let  $\omega_r = \varepsilon_1 + \dots + \varepsilon_r$ .

$$E_{\varepsilon_1 + \dots + \varepsilon_r} = x_1 x_2 \cdots x_r.$$

Let  $W^{\omega_r}$  be the set of  $z \in S_n$  such that  $z$  is the minimal length element of its coset  $z(S_r \times S_{n-r})$  in  $S_n$ . If  $z \in W^{\omega_r}$  then

$$z = \begin{pmatrix} 1 & 2 & \cdots & r & r+1 & \cdots & n \\ i_1 & i_2 & \cdots & i_r & j_1 & \cdots & j_{n-r} \end{pmatrix} \quad \text{with} \quad \begin{array}{l} i_1 < i_2 < \cdots < i_r \text{ and} \\ j_1 < j_2 < \cdots < j_{n-r} \end{array}$$

and

$$t^{\frac{1}{2}\ell(z)} T_z E_{\omega_r} = x_{i_1} \dots x_{i_r} \quad \text{and} \quad P_{\omega_r} = \sum_{z \in W^{\omega_r}} t^{\frac{1}{2}\ell(z)} T_z E_{\omega_r} = e_r,$$

is the  $r$ th elementary symmetric function.

*Proof.* Since

$$v_{\varepsilon_1 + \dots + \varepsilon_r}^{-1} = \begin{pmatrix} 1 & \cdots & r & r+1 & \cdots & n \\ r+1 & \cdots & n & 1 & \cdots & r \end{pmatrix} \quad \text{with} \quad \ell(v_{\varepsilon_1 + \dots + \varepsilon_r}^{-1}) = (n-r)r,$$

and  $u_{\varepsilon_1 + \dots + \varepsilon_r} = \pi^r$  then

$$E_{\varepsilon_1 + \dots + \varepsilon_r} = t^{-\frac{1}{2}(n-r)r} (\tau_\pi^\vee)^r \mathbf{1} = t^{-\frac{1}{2}(n-r)r} (g^\vee)^r \mathbf{1} = t^{-\frac{1}{2}(n-r)r} X_1 \cdots X_r T_{v_{\varepsilon_1 + \dots + \varepsilon_r}^{-1}} \mathbf{1}, = x_1 \cdots x_r.$$

A reduced word for  $z$  is  $z = (s_{i_1-1} \cdots s_1)(s_{i_2-1} \cdots s_2) \cdots (s_{i_r-1} \cdots s_r)$ . Then

$$\begin{aligned} t^{\frac{1}{2}\ell(z)} T_z E_{\omega_r} &= ((t^{\frac{1}{2}} T_{i_1-1}) \cdots (t^{\frac{1}{2}} T_1)) \cdot ((t^{\frac{1}{2}} T_{i_2-1}) \cdots (t^{\frac{1}{2}} T_2)) \cdots ((t^{\frac{1}{2}} T_{i_r-1}) \cdots (t^{\frac{1}{2}} T_r))(x_1 x_2 \cdots x_r) \\ &= ((t^{\frac{1}{2}} T_{i_1-1}) \cdots (t^{\frac{1}{2}} T_1)) \cdot ((t^{\frac{1}{2}} T_{i_2-1}) \cdots (t^{\frac{1}{2}} T_2)) \cdots ((t^{\frac{1}{2}} T_{i_{r-1}-1}) \cdots (t^{\frac{1}{2}} T_{r-1}))(x_1 x_2 \cdots x_{r-1} x_r) \\ &= ((t^{\frac{1}{2}} T_{i_1-1}) \cdots (t^{\frac{1}{2}} T_1)) \cdot ((t^{\frac{1}{2}} T_{i_2-1}) \cdots (t^{\frac{1}{2}} T_2)) \cdots ((t^{\frac{1}{2}} T_{i_{r-2}-1}) \cdots (t^{\frac{1}{2}} T_{r-2}))(x_1 x_2 \cdots x_{r-2} x_{i_{r-1}} x_{i_r}) \\ &= \cdots = x_{i_1} x_{i_2} \cdots x_{i_r}. \end{aligned}$$

The last equality then follows from (1.5).  $\square$

### 7.0.5 $E_\mu^z$ for a single box

**Proposition 7.3.** Let  $j \in \{1, \dots, n\}$  and let  $z \in S_n$ . Then

$$E_{\varepsilon_j}^z = c_j x_{z(j)} + \cdots + c_2 x_{z(2)} + c_1 x_{z(1)}$$

where

$$c_a = \begin{cases} \left(\frac{1-t}{1-qt^{n-j+1}}\right) q t^{C(a)}, & \text{if } z(j) < z(a), \\ \left(\frac{1-t}{1-qt^{n-j+1}}\right) t^{C(a)}, & \text{if } z(j) > z(a), \\ 1, & \text{if } z(j) = z(a). \end{cases}$$

with

$$C(a) = \begin{cases} \{k \in \{j+1, \dots, n\} \mid z(k) < z(j) < z(a) \text{ or } z(j) < z(a) < z(k)\}, & \text{if } z(j) < z(a), \\ \{k \in \{j+1, \dots, n\} \mid z(j) > z(k) > z(a)\}, & \text{if } z(j) > z(a), \end{cases}$$

*Proof.* The proof is by induction on  $\ell(z)$ . If  $z = 1$  then  $T_z = 1$  and the formula is the same as given in [GR21, Proposition 3.5(a)] for  $E_{\varepsilon_j}$ . Let  $r \in \{1, \dots, n-1\}$  such that  $s_r z > z$ . Recall

$$t^{\frac{1}{2}} T_r(x_\ell) = \begin{cases} x_{r+1}, & \text{if } \ell = r, \\ tx_r + (t-1)x_{r+1}, & \text{if } \ell = r+1, \\ tx_\ell, & \text{otherwise.} \end{cases} \quad (7.1)$$

$$t^{-\frac{1}{2}} T_r(x_\ell) = \begin{cases} t^{-1} x_{r+1}, & \text{if } r = \ell, \\ x_r + (1-t^{-1})x_{r+1}, & \text{if } \ell = r+1, \\ x_\ell, & \text{otherwise.} \end{cases} \quad (7.2)$$

Write

$$t^{-\frac{1}{2}(\ell(zv_{\varepsilon_j}^{-1}) - \ell(v_{\varepsilon_j}^{-1}))} E_{\varepsilon_j}^z = \sum_{i=1}^n c_i^z x_{z(i)}.$$

Then

$$\begin{aligned} t^{\frac{1}{2}} T_r(c_a^z x_r + c_b^z x_{r+1}) &= c_a^z x_{r+1} + c_b^z (tx_r + (t-1)x_{r+1}) = tc_b^z x_r + (c_b^z(t-1) + c_a^z)x_{r+1}, \\ \text{giving } c_a^{s_r z} &= tc_b^z \text{ and } c_b^{s_r z} = c_b^z(t-1) + c_a^z. \end{aligned}$$

$$\begin{aligned} t^{-\frac{1}{2}} T_r(c_a^z x_r + c_b^z x_{r+1}) &= t^{-1} c_a^z x_{r+1} + c_b^z (x_r + (1-t^{-1})x_{r+1}) = c_b^z x_r + (c_b^z(1-t^{-1}) + t^{-1}c_a^z)x_{r+1} \\ \text{giving } c_a^{s_r z} &= c_b^z \text{ and } c_b^{s_r z} = c_b^z(1-t^{-1}) + t^{-1}c_a^z. \end{aligned}$$

Let

$$a = z^{-1}(r) \text{ and } b = z^{-1}(r+1) \quad \text{so that} \quad b = (s_r z)^{-1}(r) \text{ and } a = (s_r z)^{-1}(r+1).$$

Assume  $s_r z > z$  so that  $a < b$ .

(lll)	$z(j) < r$	$a < j \quad b < j \quad c_a^z = c_b^z$	multiply by $t^{-\frac{1}{2}}T_r \quad c_a^{s_r z} = c_b^{s_z} = c_a^z$
(llg)	$z(j) < r$	$a < j \quad b > j \quad c_b^z = 0$	multiply by $t^{-\frac{1}{2}}T_r \quad c_a^{s_r z} = 0, \quad c_b^{s_r z} = t^{-1}c_a^z$
(lgg)	$z(j) < r$	$a > j \quad b > j \quad c_a^z = c_b^z = 0$	multiply by $t^{-\frac{1}{2}}T_r \quad c_a^{s_r z} = c_b^{s_r z} = 0$
(ele)	$z(j) = r$	$a = j \quad b > j \quad c_a^z = 1, \quad c_b^z = 0$	multiply by $t^{\frac{1}{2}}T_r \quad c_a^{s_r z} = 0, \quad c_b^{s_r z} = 1,$
(flf)	$z(j) = r+1$	$a < j \quad b = j \quad c_b^z = 1$	multiply by $t^{-\frac{1}{2}}T_r$
(gll)	$z(j) > r+1$	$a < j \quad b < j \quad c_a^z = c_b^z$	multiply by $t^{-\frac{1}{2}}T_r \quad c_a^{s_r z} = c_b^{s_z} = c_a^z$
(glg)	$z(j) > r+1$	$a < j \quad b > j \quad c_b^z = 0$	multiply by $t^{-\frac{1}{2}}T_r \quad c_a^{s_r z} = 0, \quad c_b^{s_r z} = t^{-1}c_a^z$
(ggg)	$z(j) > r+1$	$a > j \quad b > j \quad c_a^z = c_b^z = 0$	multiply by $t^{-\frac{1}{2}}T_r \quad c_a^{s_r z} = c_b^{s_r z} = 0$

Now we need to show that the statistics  $C(a)$  provide the same recursions.

In the case (flf),  $r+1 = z(j) > z(a) = r$  with  $C(a) = 0$  and  $r = (s_r z)(j) < (s_r z)(a) = r+1$  and  $C(a) = n-j$ . So

$$c_j^z = 1, \quad c_a^z = \left( \frac{1-t}{1-qt^{n-j+1}} \right) t^0 \quad \text{and} \quad c_j^{s_r z} = 1, \quad c_a^{s_r z} = \left( \frac{1-t}{1-qt^{n-j+1}} \right) qt^{n-j}$$

since

$$\begin{aligned} c_a^{s_r z} &= (1-t^{-1}) + t^{-1} \left( \frac{1-t}{1-qt^{n-j+1}} \right) t^0 \\ &= \left( \frac{1-t}{1-qt^{n-j+1}} \right) (-t^{-1}(1-qt^{n-j+1}) + t^{-1}) = \left( \frac{1-t}{1-qt^{n-j+1}} \right) qt^{n-j}. \end{aligned}$$

□

Some examples are

$$\begin{aligned} (t^{\frac{1}{2}}T_{i+(k-1)}) \cdots (t^{\frac{1}{2}}T_i) E_{\varepsilon_i} &= x_{i+k} + \frac{(1-t)}{(1-qt^{n-(i-1)})} t^k (x_{i-1} + \cdots + x_1), \\ (t^{-\frac{1}{2}}T_{i-k}) \cdots (t^{-\frac{1}{2}}T_{i-1}) E_{\varepsilon_i} &= x_{i-k} + \frac{(1-t)}{(1-qt^{n-(i-1)})} \left( qt^{n-i} (x_i + x_{i-1} + \cdots + x_{i-(k-1)}) + (x_{i-(k+1)} + \cdots + x_1) \right), \end{aligned}$$

### 7.0.6 The nonattacking fillings for $E_{\varepsilon_i}$ .

The box greedy reduced word for  $u_{\varepsilon_i}$  is

$$u_{\varepsilon_i}^\square = \left[ \begin{array}{c|c} \square & s_{i-1} \cdots s_1 \pi \\ \vdots & \boxed{s_{i-1} \cdots s_1 \pi} \\ \square & \end{array} \right] \quad \text{with } i \text{ non-attacking fillings,} \quad \begin{array}{c|c} 1 & 1 \\ \vdots & \vdots \\ i & i \\ \vdots & \vdots \\ n & n \\ i & i > k \\ \hline & \left( \frac{1-t}{1-qt^{n-(i-1)}} \right) \end{array}$$

### 7.0.7 The nonattacking fillings for $E_{\varepsilon_i}^z$ .

If  $z(i) = i + k$  then the  $i$  non-attacking fillings are

$$\begin{array}{c|c} z(1) & z(1) \\ \vdots & \vdots \\ i+k & i+k \\ \vdots & \vdots \\ z(n) & z(n) \\ \hline t^{-k} & \left(\frac{1-t}{1-qt^{n-(i-1)}}\right) \end{array} \quad \begin{array}{c|c} & i > j \geq 1 \\ & \vdots \\ & j \end{array}$$

If  $z(i) = i - k$  then the  $i$  non-attacking fillings are

$$\begin{array}{c|c|c} z(1) & z(1) & z(1) \\ \vdots & \vdots & \vdots \\ i-k & j & i-k \\ \vdots & \vdots & \vdots \\ z(n) & z(n) & z(n) \\ \hline i \geq j > i-k & 1 & i-k > j \geq 1 \\ \left(\frac{(1-t)qt^{n-i}}{1-qt^{n-(i-1)}}\right) & & \left(\frac{1-t}{1-qt^{n-(i-1)}}\right) \end{array}$$

### 7.0.8 The nonattacking fillings for $E_{2\varepsilon_i}$

The box greedy reduced word for  $u_{2\varepsilon_i}$  is

$$u_{2\varepsilon_i}^{\square} = (s_{i-1} \cdots s_1 \pi)(s_{n-1} \cdots s_1 \pi) = \begin{array}{c|c} \square & \vdots \\ \vdots & \vdots \\ \square & \vdots \\ \vdots & \vdots \\ \square & \vdots \end{array} \quad \begin{array}{c|c} s_{i-1} \cdots s_1 \pi & s_{n-1} \cdots s_1 \pi \end{array}$$

The case  $E_{2\varepsilon_i}$  has  $i \cdot n$  nonattacking fillings and  $2^{n+i-2}$  alcove walks. There are no covid triples for any of the nonattacking fillings so that  $t^{covid(T)} = t^0 = 1$ , and  $q^{maj(T)} = q^1 = q$  exactly when  $T(i, 1) < T(i, 2)$ .

$$\begin{array}{c|c|c|c|c} 1 & 1 & 1 & 1 & 1 \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ i & i & i & i & i \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ n & n & n & n & n \\ \hline k < i & \ell > i & k < i & k < i & k < i \\ \left(\frac{1-t}{1-q^2t^{n-(i-1)}}\right) & \left(\frac{1-t}{1-qt}\right)q & \left(\frac{1-t}{1-qt}\right) & \left(\frac{1-t}{1-q^2t^{n-(i-1)}}\right)\left(\frac{1-t}{1-qt}\right)q \end{array}$$

$$\begin{array}{c|cc} 1 & & 1 \\ \vdots & & \vdots \\ i & k & \ell \\ \vdots & & \vdots \\ n & & n \end{array} \quad \begin{array}{c|cc} k < i, \ell > i & \{k, \ell\} \subseteq \{1, \dots, i-1\} \\ \left(\frac{1-t}{1-q^2 t^{n-(i-1)}}\right) \left(\frac{1-t}{1-qt}\right) q & \left(\frac{1-t}{1-q^2 t^{n-(i-1)}}\right) \left(\frac{1-t}{1-qt}\right) \end{array} \quad \begin{array}{c|cc} 1 & & 1 \\ \vdots & & \vdots \\ i & k & \ell \\ \vdots & & \vdots \\ n & & n \end{array} \quad \begin{array}{c|cc} \{k, \ell\} \subseteq \{1, \dots, i-1\} & \{k, \ell\} \subseteq \{1, \dots, i-1\} \\ \left(\frac{1-t}{1-q^2 t^{n-(i-1)}}\right) \left(\frac{1-t}{1-qt}\right) q & \left(\frac{1-t}{1-q^2 t^{n-(i-1)}}\right) \left(\frac{1-t}{1-qt}\right) q \end{array}$$

### 7.0.9 The nonattacking fillings for $E_{\varepsilon_{j_1} + \varepsilon_{j_2}}$ .

Let  $j_1, j_2 \in \{1, \dots, n\}$  with  $j_1 < j_2$ . The box greedy reduced word for  $u_{\varepsilon_{j_1} + \varepsilon_{j_2}}$  is

$$u_{\varepsilon_{j_1} + \varepsilon_{j_2}}^\square = \begin{array}{c} \square \\ \vdots \\ \square \\ \vdots \\ \square \\ \vdots \\ \square \end{array} \quad \boxed{s_{j_1-1} \cdots s_1 \pi} \quad \boxed{s_{j_2-2} \cdots s_1 \pi}$$

$E_{\varepsilon_{j_1} + \varepsilon_{j_2}}$  has  $j_1(j_2 - 1)$  nonattacking fillings and  $2^{j_1-1}2^{j_2-2}$  alcove walks.

$$\begin{array}{c|c|c|c|c|c|c|c}
1 & \left| \begin{array}{c} 1 \\ \vdots \\ j_1 \\ \vdots \\ j_2 \\ \vdots \\ n \end{array} \right| & 1 & \left| \begin{array}{c} 1 \\ \vdots \\ j_1 \\ \vdots \\ j_2 \\ \vdots \\ n \end{array} \right| & 1 & \left| \begin{array}{c} 1 \\ \vdots \\ j_1 \\ \vdots \\ j_2 \\ \vdots \\ n \end{array} \right| & 1 & \left| \begin{array}{c} 1 \\ \vdots \\ j_1 \\ \vdots \\ j_2 \\ \vdots \\ n \end{array} \right| \\
& j_1 & j_1 & k & j_1 & j_1 & k & j_1 & j_1 \\ 
& \vdots \\ 
j_1 & j_1 & j_1 & k & j_1 & j_1 & k & j_1 & j_1 \\ 
\vdots & \vdots \\

\vdots & \vdots \\ 
n & n & n & n & n & n & n & n & n \\ 
\hline
k \in \{1, \dots, j_1 - 1\} & \{k, \ell\} \subseteq \{1, \dots, j_1 - 1\} & \{k, \ell\} \subseteq \{1, \dots, j_1 - 1\} & \{k, \ell\} \subseteq \{1, \dots, j_1 - 1\} & \{k, \ell\} \subseteq \{1, \dots, j_1 - 1\} \\
\ell \in \{j_1 + 1, \dots, j_2 - 1\} & \left( \frac{1-t}{1-qt^{n-(j_2-2)}} \right) \left( \frac{1-t}{1-qt^{n-j_1}} \right) ? \\ 
\end{array}$$

## 8 Queue tableaux

### 8.0.1 An instance of compression of NAFs – Motivation for Queue Tableaux.

In [GR21, Proposition 3.5(c)], if  $j_1 = j_2 - 1$  then the third and fifth summands disappear to give

$$\begin{aligned} E_{\varepsilon_{j_2-1}+\varepsilon_{j_2}} &= x_{j_2-1}x_{j_2} + \left(\frac{1-t}{1-qt^{n-(j_2-1)}}\right) \sum_{k=1}^{j_2-2} x_k x_{j_2} + \left(\frac{1-t}{1-qt^{n-(j_2-2)}}\right) \left(\frac{1-t}{1-qt^{n-(j_2-1)}} + t\right) \sum_{k=1}^{j_2-2} x_k x_{j_2-1} \\ &\quad + \left(\frac{1-t}{1-qt^{n-(j_2-2)}}\right) \left(\frac{1-t}{1-qt^{n-j_1}}\right) (1+t) \sum_{\{k,\ell\} \subseteq \{1, \dots, j_2-2\}} x_k x_\ell \\ &= x_{j_2-1}x_{j_2} + \left(\frac{1-t}{1-qt^{n-(j_2-1)}}\right) \sum_{k=1}^{j_2-2} x_k x_{j_2} + \left(\frac{1-t}{1-qt^{n-(j_2-2)}}\right) \left(\frac{1-qt^{n-(j_2-2)}}{1-qt^{n-(j_2-1)}}\right) \sum_{k=1}^{j_2-2} x_k x_{j_2-1} \\ &\quad + \left(\frac{1-t}{1-qt^{n-(j_2-2)}}\right) \left(\frac{1-t}{1-qt^{n-(j_2-1)}}\right) (1+t) \sum_{\{k,\ell\} \subseteq \{1, \dots, j_2-2\}} x_k x_\ell \end{aligned}$$

which is an example of the additional cancellation that occurs when there are adjacent rows of equal length and illustrates the difference between nonattacking fillings and queue tableaux.

### 8.0.2 Queue tableaux

Following (and slightly generalizing) [CMW18, Definition A.1], a *queue tableau* of shape  $(z, \mu)$  is a nonattacking filling  $T$  of  $(z, \mu)$  such that

(QT) If  $\mu_i = \mu_{i-1} = \dots = \mu_{i-r}$  then  $T(i, j) \notin \{T(i-1, j-1), \dots, T(i-r, j-1)\}$ .

If the parts of  $\mu$  are distinct then a queue tableau is no different than a nonattacking filling. More generally, if  $\mu_i \neq \mu_{i+1}$  for  $i \in \{1, \dots, n-1\}$  then a queue tableau is no different than a nonattacking filling.

### 8.0.3 Multiline queues

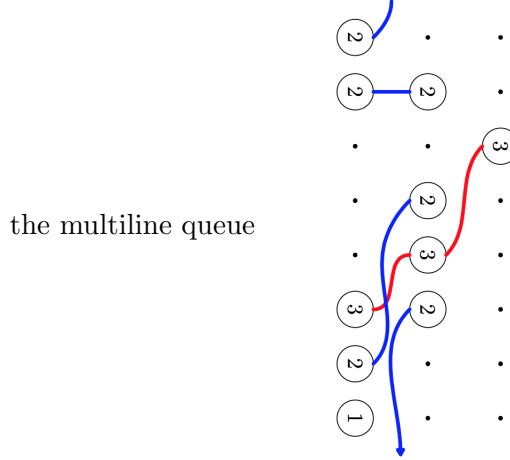

The *multiline queue* corresponding to a queue tableau  $T$  is the pipe dream  $P$  corresponding to  $T$  under the map given in (3.7), namely

$$P(k, j) = i \quad \text{if and only if} \quad T(i, j) = k,$$

The example in [CMW18, Figures 3 and 12] has

$$\text{queue tableau } T = \begin{array}{c|cccc} 6 & 6 & 5 & 3 \\ 1 & 1 & 6 \\ 2 & 2 & 2 \\ \hline 7 & 7 & 4 \\ 8 & 8 \end{array} \quad \text{and pipe dream } P = \begin{pmatrix} 2 & 2 & 0 & 0 \\ 3 & 3 & 3 & 0 \\ 6 & 0 & 0 & 1 \\ \hline 7 & 0 & 4 & 0 \\ 8 & 0 & 1 & 0 \\ 1 & 1 & 2 & 0 \\ 4 & 4 & 0 & 0 \\ 5 & 5 & 0 & 0 \end{pmatrix}$$

The picture of this pipe dream from [CMW18, Figures 3] is

#### 8.0.4 Compression not captured by NAFs or QT

Let  $\text{AW}_\mu = \text{AW}_\mu^{\text{id}}$ ,  $\text{NAF}_\mu = \text{NAF}_\mu^{\text{id}}$ , and  $\text{QT}_\mu = \text{QT}_\mu^{\text{id}}$ . The example

$$\#\text{AW}_{(2,2,1,1,0,0)} = 16, \quad \#\text{NAF}_{(2,2,1,1,0,0)} = 9 \quad \text{and} \quad \#\text{QT}_{(2,2,1,1,0,0)} = 7.$$

is provided in [CMW18, Figure 4]). The equalities (see (see [GR21, Proposition 5.8]))

$$\begin{aligned} E_{(2,0,1)}(x_1, x_2, x_3; q, t) &= (x_1 x_2 x_3)^2 E_{(1,2,0)}(x_3^{-1}, x_2^{-1}, x_1^{-1}; q, t), \quad \text{and} \\ E_{(2,2,0)}(x_1, x_2, x_3; q, t) &= q^{-1} E_{(2,0,1)}(x_3, x_1, x_2; q, t) \end{aligned}$$

indicate that if one provides a formula for  $E_{(1,2,0)}$  then there are formulas for  $E_{(2,0,1)}$  and  $E_{(2,2,0)}$  with exactly the same number of terms. For these cases,

$$\#\text{AW}_{(1,2,0)} = 4, \quad \#\text{NAF}_{(1,2,0)} = 3, \quad \#\text{QT}_{(1,2,0)} = 3.$$

$$\#\text{AW}_{(2,0,1)} = 4, \quad \#\text{NAF}_{(2,0,1)} = 4, \quad \#\text{QT}_{(2,0,1)} = 4.$$

$$\#\text{AW}_{(2,2,0)} = 4, \quad \#\text{NAF}_{(2,2,0)} = 4, \quad \#\text{QT}_{(2,2,0)} = 3.$$

Thus  $\mu = (2, 0, 1)$  is a case where possible compression is not realized by either the NAFs or the QT.

#### 8.0.5 Comparing #NAF and #QT for $(r, 0, \dots, 0)$ and $(r, \dots, r, 0)$ .

Since  $u_{(r,0,\dots,0)} = \pi(s_{n-1} \cdots s_1 \pi)^{r-1}$  and  $u_{(r,r,\dots,r,0)} = \pi^{n-1} (s_1 \pi)^{(n-1)(r-1)}$  then

$$\begin{aligned} \#\text{AW}_{(r,0,0,\dots,0)} &= (2^{n-1})^{r-1}, & \#\text{NAF}_{(r,0,0,\dots,0)} &= n^{r-1}, & \#\text{QT}_{(r,0,0,\dots,0)} &= n^{r-1}, \\ \#\text{AW}_{(r,r,\dots,r,0)} &= (2^{n-1})^{r-1}, & \#\text{NAF}_{(r,r,\dots,r,0)} &= (2^{n-1})^{r-1}, & \#\text{QT}_{(r,r,\dots,r,0)} &= n^{r-1}. \end{aligned}$$

To see the last equality: In a queue tableau of shape  $(r, r, \dots, r, 0)$ , for each column after the first, we get to choose the position of the  $j \in \{1, \dots, n\}$  that did not appear in the column before ( $n$  choices total for each column).
