### Examples

Normed vector spaces:  $\mathbb{R}^n$  with

$$\|x\| = (|x_1|^2 + \dots + |x_n|^2)^{1/2} \text{ if } x = (x_1, x_2, \dots, x_n)$$

Symmetric inner product spaces

(a)  $V = \mathbb{R}^n$  is an  $\mathbb{R}$ -vector space with

$$\langle x, y \rangle = x_1 y_1 + \dots + x_n y_n \text{ if } x = (x_1, \dots, x_n), y = (y_1, \dots, y_n)$$

(b)  $V = \mathbb{C}^n$  is a  $\mathbb{C}$ -vector space with

$$\langle x, y \rangle = x_1 y_1 + \dots + x_n y_n \text{ if } x = (x_1, \dots, x_n), y = (y_1, \dots, y_n).$$

Positive definite Hermitian inner product spaces

(a)  $V = \mathbb{R}^n$  as an  $\mathbb{R}$ -vector space with

$$\langle x, y \rangle = x_1 \bar{y}_1 + \dots + x_n \bar{y}_n, \text{ if } x = (x_1, \dots, x_n), y = (y_1, \dots, y_n)$$

(b)  $V = \mathbb{C}$  is a  $\mathbb{C}$ -vector space with

$$\langle x, y \rangle = x_1 \bar{y}_1 + \dots + x_n \bar{y}_n \text{ if } x = (x_1, \dots, x_n), y = (y_1, \dots, y_n).$$

(Note:  $\bar{y}_i = y_i$  if  $y_i \in \mathbb{R}$ , as in case (a)).

Bases Let  $K$  be  $\mathbb{R}$  or  $\mathbb{C}$ .

Let  $V$  be a  $K$ -vector space.

A (Hamel) basis of  $V$  is a subset  $B \subseteq V$  such that

(a)  $K\text{-span}(B) = V$

(b)  $B$  is linearly independent,

where

$$K\text{-span}(B) = \left\{ a_1 b_1 + \dots + a_l b_l \mid l \in \mathbb{Z}_{>0}, b_1, \dots, b_l \in B, a_1, \dots, a_l \in K \right\}$$

and  $B$  is linearly independent if  $B$  satisfies

if  $l \in \mathbb{Z}_{>0}$  and  $b_1, \dots, b_l \in B$  and  $a_1, \dots, a_l \in K$  and  $a_1 b_1 + \dots + a_l b_l = 0$  then  $a_1 = 0, a_2 = 0, \dots, a_l = 0$ .

A Schauder basis of  $V$  is a sequence

$(b_1, b_2, \dots)$  in  $V$  such that

if  $v \in V$  then there exists a unique sequence  $(a_1, a_2, \dots)$  in  $K$  such that  $\sum_{i=1}^{\infty} a_i b_i = v$ .

Note:  $v = \sum_{i=1}^{\infty} a_i b_i$  means  $v = \lim_{n \rightarrow \infty} s_n$  where

$s_1 = a_1 b_1, s_2 = a_1 b_1 + a_2 b_2, \dots$ . Hence,

if  $(b_1, b_2, \dots)$  is a Schauder basis then  $V \subseteq \overline{K\text{-span}\{b_1, b_2, \dots\}}$

When is  $\overline{\mathbb{K}\text{-span}(B)} = V$ ?

1744 Lec 22 (3)

Let  $e_1 = (1, 0, 0, \dots)$ ,  $e_2 = (0, 1, 0, 0, \dots)$ , ...  
with  $e_i$  having 1 in the  $i^{\text{th}}$  entry and all other  
entries 0. Then

$$c_c = \mathbb{R}\text{-span}\{e_1, e_2, \dots\} = \left\{ \text{sequences } (a_1, a_2, \dots) \in \mathbb{R}^{\infty} \text{ with} \right. \\ \left. \text{all but a finite number of} \right. \\ \left. \text{entries equal to 0} \right\}$$

Then,

$$\text{in } \mathbb{R}^1, \quad \overline{\mathbb{R}\text{-span}\{e_1, e_2, \dots\}} = \mathbb{R}^1,$$

$$\text{in } \mathbb{R}^p \text{ with } p \in \mathbb{R}_{>1}, \quad \overline{\mathbb{R}\text{-span}\{e_1, e_2, \dots\}} = \mathbb{R}^p$$

$$\text{in } \mathbb{R}^{\infty}, \quad \overline{\mathbb{R}\text{-span}\{e_1, e_2, \dots\}} = c_0, \text{ where}$$

$$c_0 = \{ (a_1, a_2, \dots) \in \mathbb{R}^{\infty} \mid \lim_{n \rightarrow \infty} a_n = 0 \}$$

is the set of sequences in  $\mathbb{R}$  which converge  
to 0. Since

$$(1, 1, 1, \dots) \in \mathbb{R}^{\infty} \text{ and } (1, 1, 1, \dots) \notin c_0$$

$$\text{then } c_0 \subsetneq \mathbb{R}^{\infty}.$$

$$\text{So } \overline{\mathbb{R}\text{-span}\{e_1, e_2, \dots\}} \neq \mathbb{R}^{\infty}.$$

Proposition Let  $(V, \|\cdot\|)$  be a normed vector space.

Then  $V$  has a countable dense set  $C$   
if and only if

$V$  has a countable subset  $B$  with  $\overline{\mathbb{K}\text{-span}(B)} = V$ .

Proof  $\Rightarrow$ : Assume  $C$  is a countable dense subset of  $V$ .

To show: There is a countable subset  $B \subseteq V$   
with  $\overline{\mathbb{K}\text{-span}(B)} = V$ .

Let  $B = C$ .

To show:  $\overline{\mathbb{K}\text{-span}(B)} = V$ .

Since  $C \subseteq \mathbb{K}\text{-span}(C) = \mathbb{K}\text{-span}(B)$  then

$$V = \overline{C} \subseteq \overline{\mathbb{K}\text{-span}(B)}. \quad \text{So } V = \overline{\mathbb{K}\text{-span}(B)}$$

$\Leftarrow$  Assume  $V$  has a countable subset  $B$  with  
 $\overline{\mathbb{K}\text{-span}(B)} = V$ .

To show:  $V$  has a countable dense set  $C$ .

Let  $\mathbb{F} = \mathbb{Q}$  if  $\mathbb{K} = \mathbb{R}$  and let  $\mathbb{F} = \mathbb{Q} + i\mathbb{Q}$  if  $\mathbb{K} = \mathbb{C}$ .

Let  $C = \mathbb{F}\text{-span}(B)$ .

The  $C$  is countable and

$$\overline{C} = \overline{\mathbb{F}\text{-span}(B)} \supseteq \overline{\mathbb{F}\text{-span}(B)} = \overline{\mathbb{K}\text{-span}(B)} = V.$$

So  $\overline{C} = V$ . So  $C$  is dense in  $V$ .  $\square$
